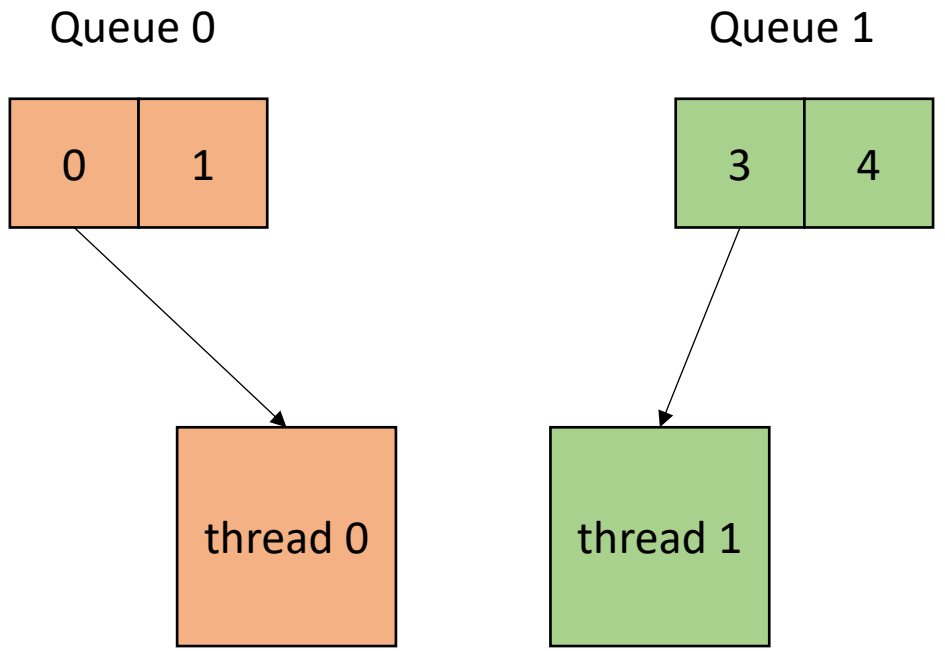
CSE113: Parallel Programming

- **Topics**:
  - DOALL loops
  - Static scheduling
  - Workstealing



Announcements

- Midterm graded
- HW 1 is graded
- HW 2 graded this week.
- HW 3 due this week
  - You should be able to do part 2 after today's lecture.

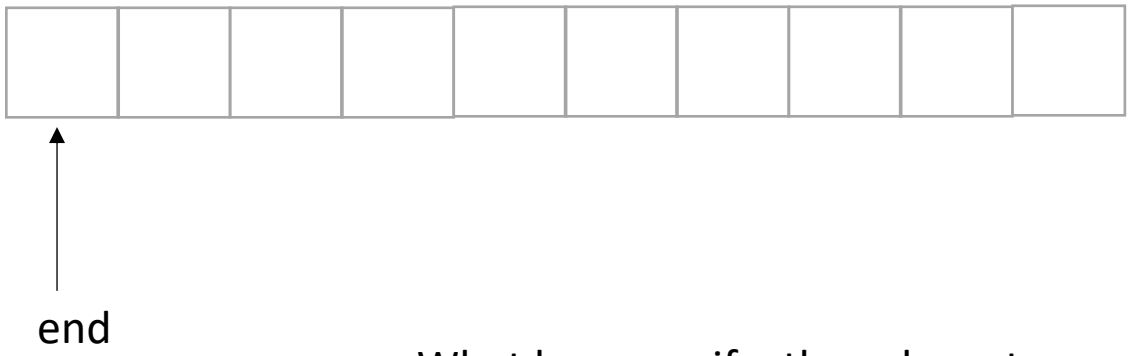
Previous quiz + Review

Previous quiz + Review

Input/output queues use atomic increments and decrements to protect against threads that are trying to concurrently enqueue and dequeue

- ◯ True
- ◯ False

Implementation



Thread 0:
enq(6);

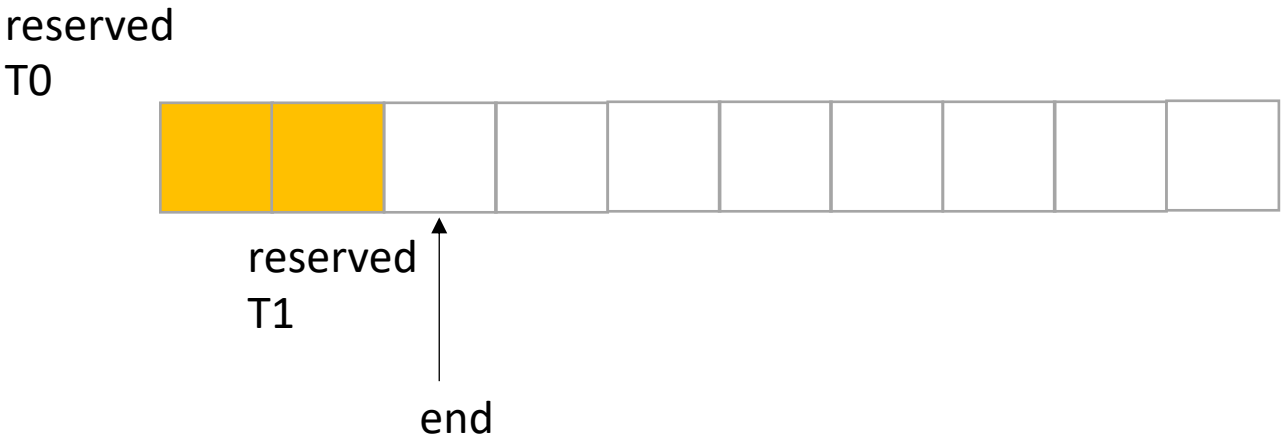
Thread 1:
enq(7);

What happens if a thread wants to add an element?

Think concurrently:

```
reserved_index = atomic_fetch_add(&end, 1);
```

Implementation



Thread 0:
enq(6);

Thread 1:
enq(7);

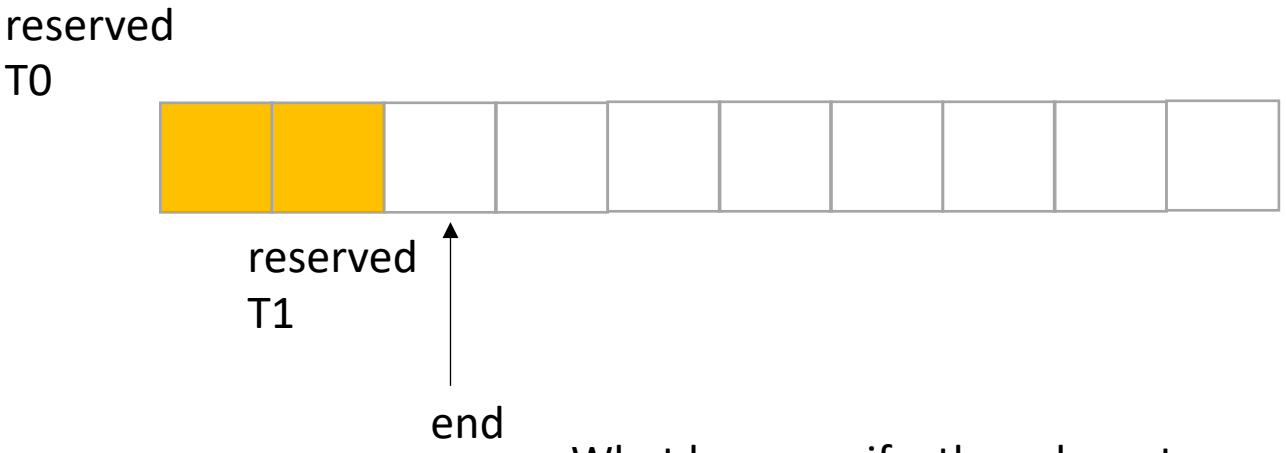
What happens if a thread wants to add an element?

Think concurrently:

```
reserved_index = atomic_fetch_add(&end, 1);
```

Implementation

does it matter which order threads add their data?



Thread 0:
enq(6);

Thread 1:
enq(7);

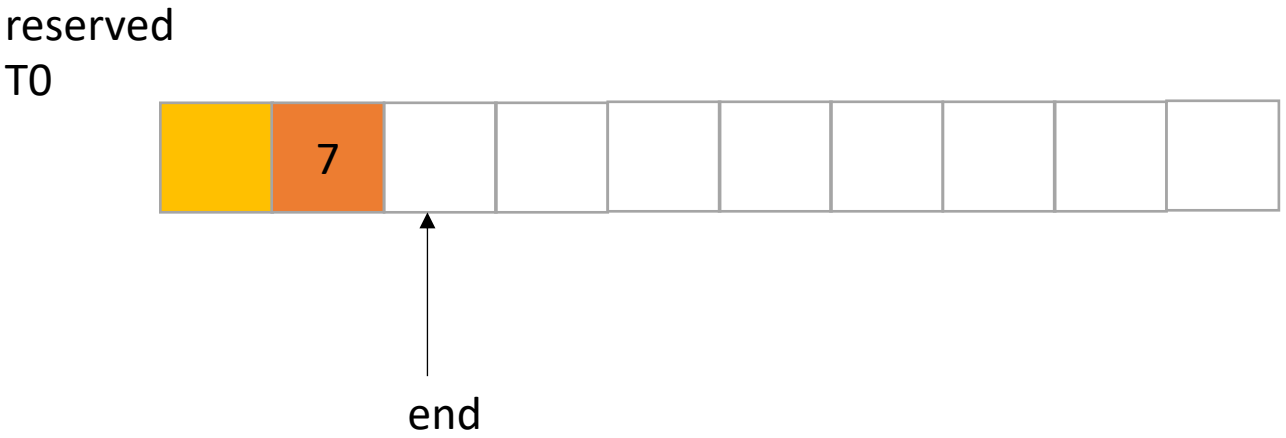
What happens if a thread wants to add an element?

Think concurrently:

```
reserved_index = atomic_fetch_add(&end, 1);
```

Implementation

does it matter which order threads add their data?



Thread 0:
enq(6);

Thread 1:
enq(7);

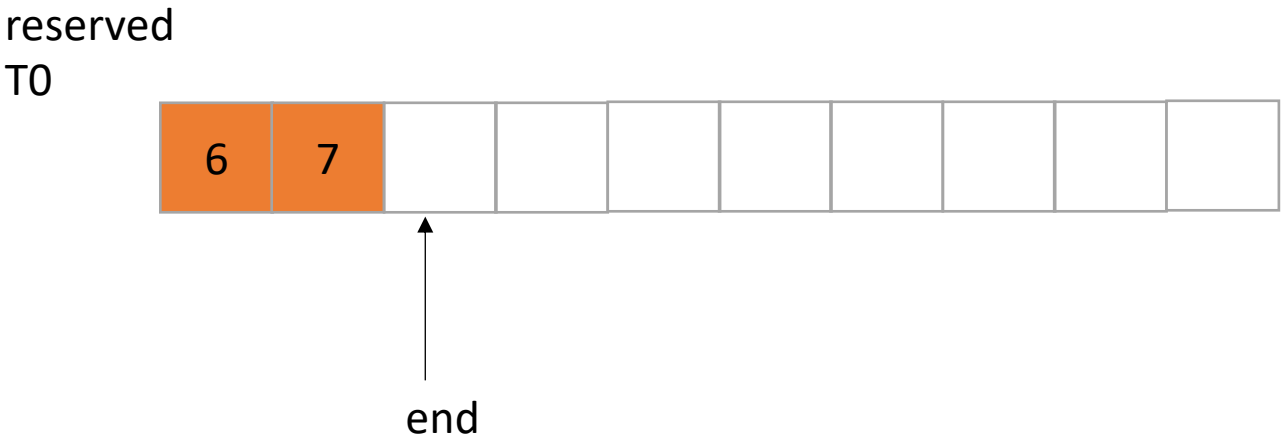
What happens if a thread wants to add an element?

Think concurrently:

```
reserved_index = atomic_fetch_add(&end, 1);
```

Implementation

does it matter which order threads add their data? No! Because there are no deqs!



Thread 0:
enq(6);

Thread 1:
enq(7);

What happens if a thread wants to add an element?

Think concurrently:

```
reserved_index = atomic_fetch_add(&end, 1);
```

Previous quiz + Review

Write a few questions about the pros and cons of using a specialized concurrent queue (e.g. an IO queue) and a fully general concurrent queue.

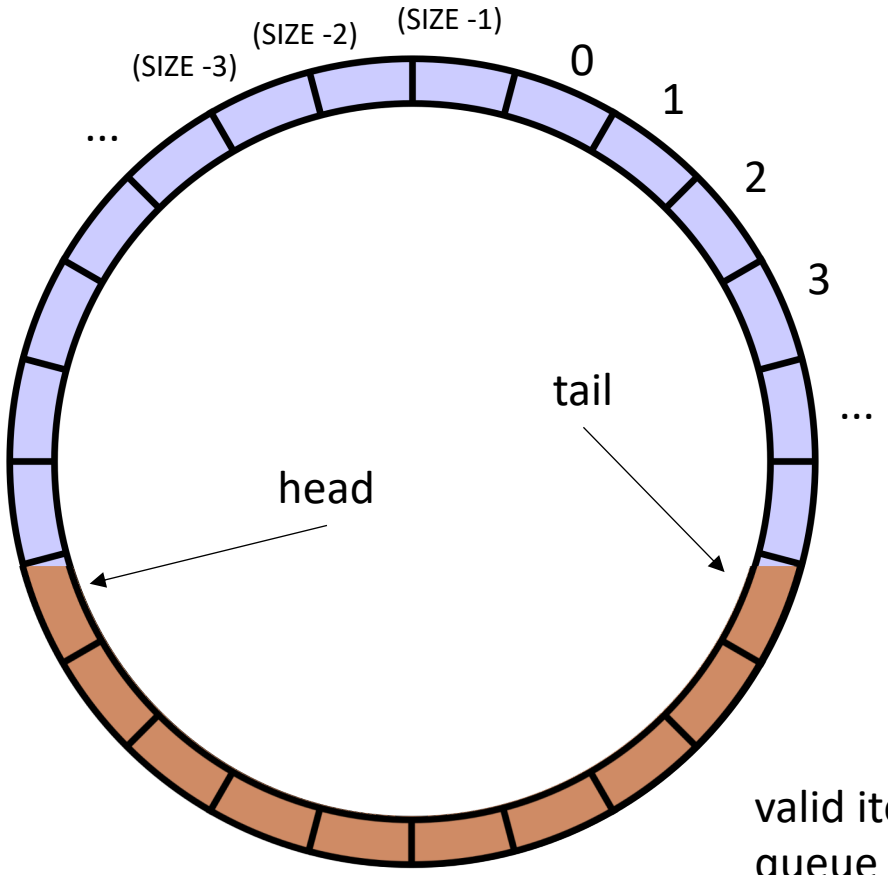
```
class InputOutputQueue {
  private:
    atomic_int front;
    atomic_int end;
    int list[SIZE];

  public:
    InputOutputQueue() {
        front = end = 0;
     }

     void enq(int x) {
        int reserved_index = atomic_fetch_add(&end, 1);
        list[reserved_index] = x;
     }

     void deq() {
       int reserved_index = atomic_fetch_add(&front, 1);
       return list[reserved_index];
     }

     int size() {
        return end.load() - front.load();
     }
 }
```



valid items in the queue

```
class ProdConsQueue {
  private:
    atomic_int head;
    atomic_int tail;
    int buffer[SIZE];

  public:
    void enq(int x) {
      // wait for there to be room
      // store value at head
      // increment head
    }
    int deq() {
      // wait while queue is empty
      // get value at tail
      // increment tail
    }
}
```

Previous quiz + Review

The performance of an application using a producer-consumer queue depends most on:

- ◯ If the queue is implemented using mutex or not
- ◯ The rate at which the consumer enqueues elements
- ◯ The rate at which the producer enqueues elements

Previous quiz + Review

A circular buffer is:

- ◯ A useful data representation for fixed-length queues
- ◯ Part of the C++ standard library
- ◯ A special type of memory that is organized in circular patters

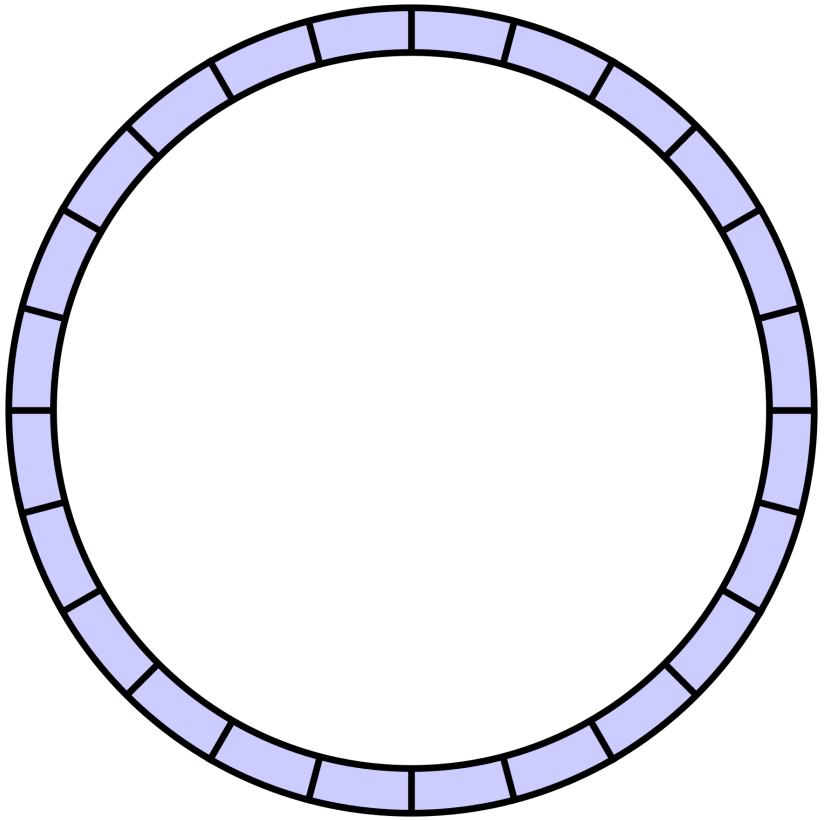
Producer Consumer Queues

- Start with a fixed size array

We will use what is called a *circular buffer method*

Producer Consumer Queues

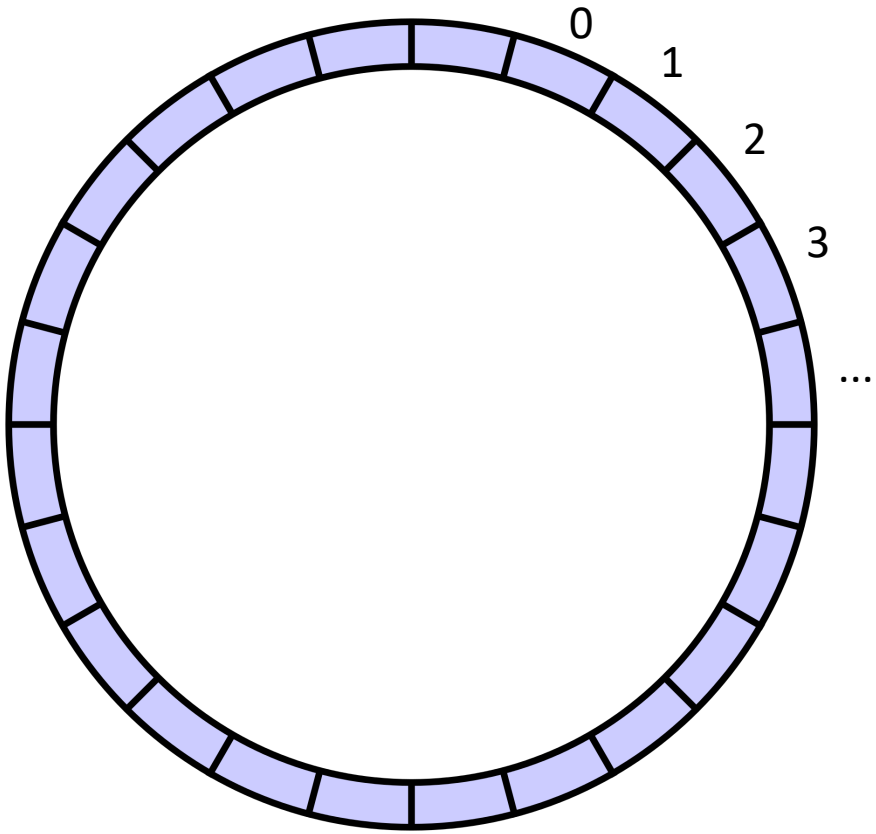
- Start with a fixed size array



conceptually it is a circle

Producer Consumer Queues

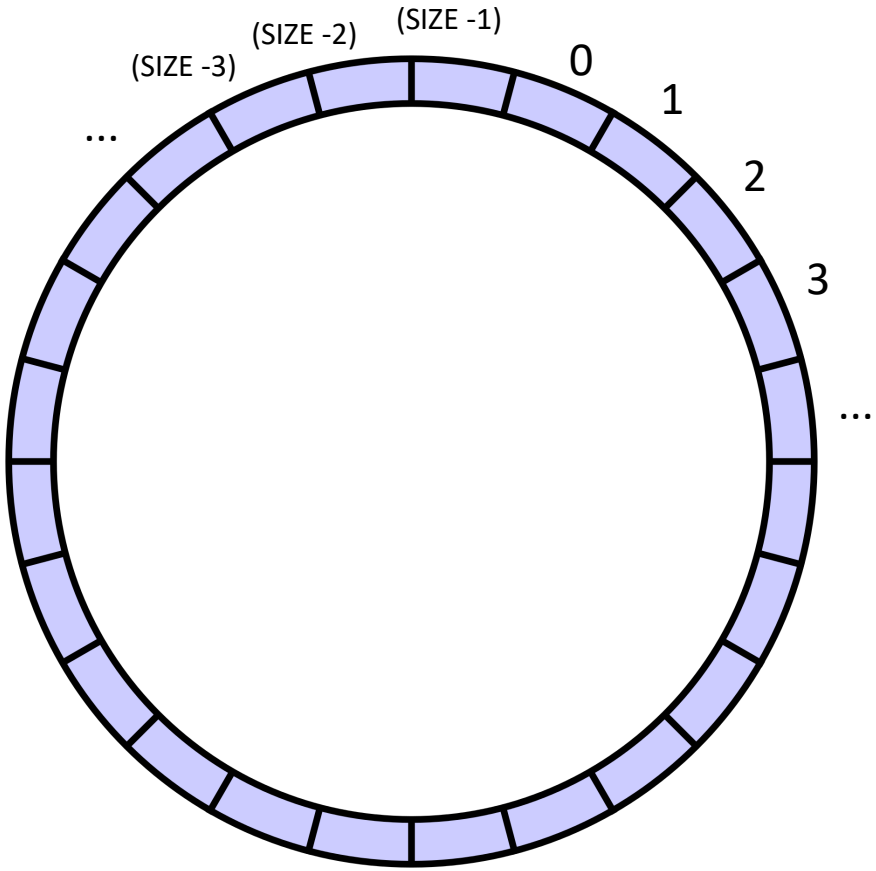
- Start with a fixed size array



conceptually it is a circle

Producer Consumer Queues

- Start with a fixed size array

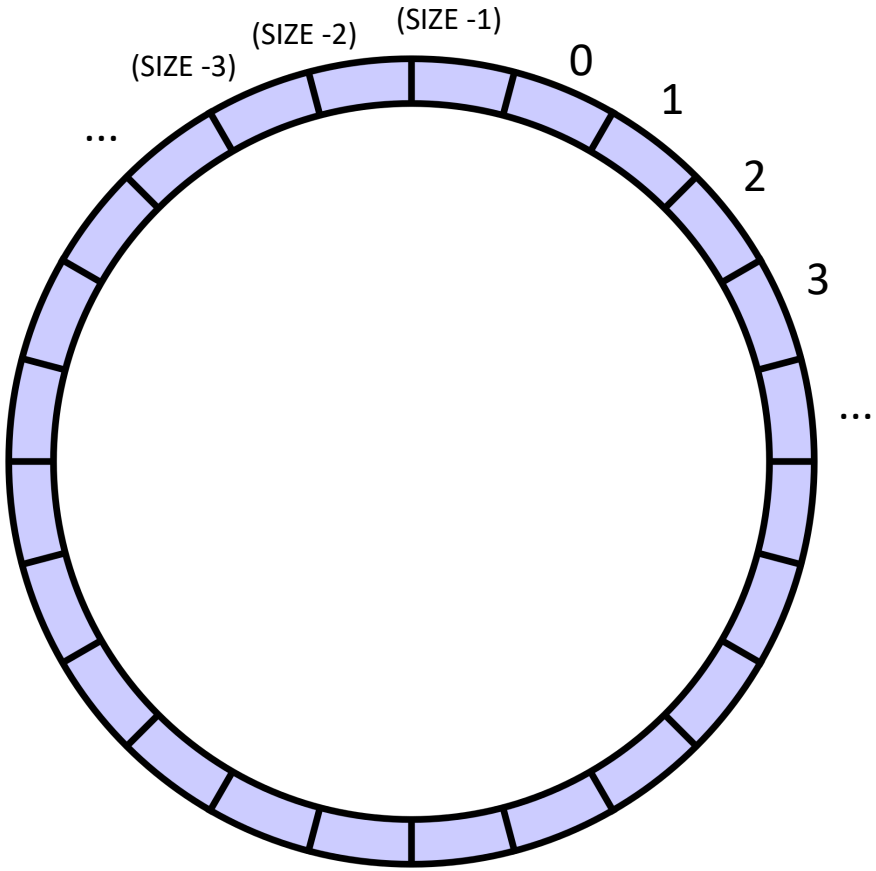


indexes will circulate in order and wrap around

conceptually it is a circle

Producer Consumer Queues

- Start with a fixed size array



indexes will circulate in order and wrap around

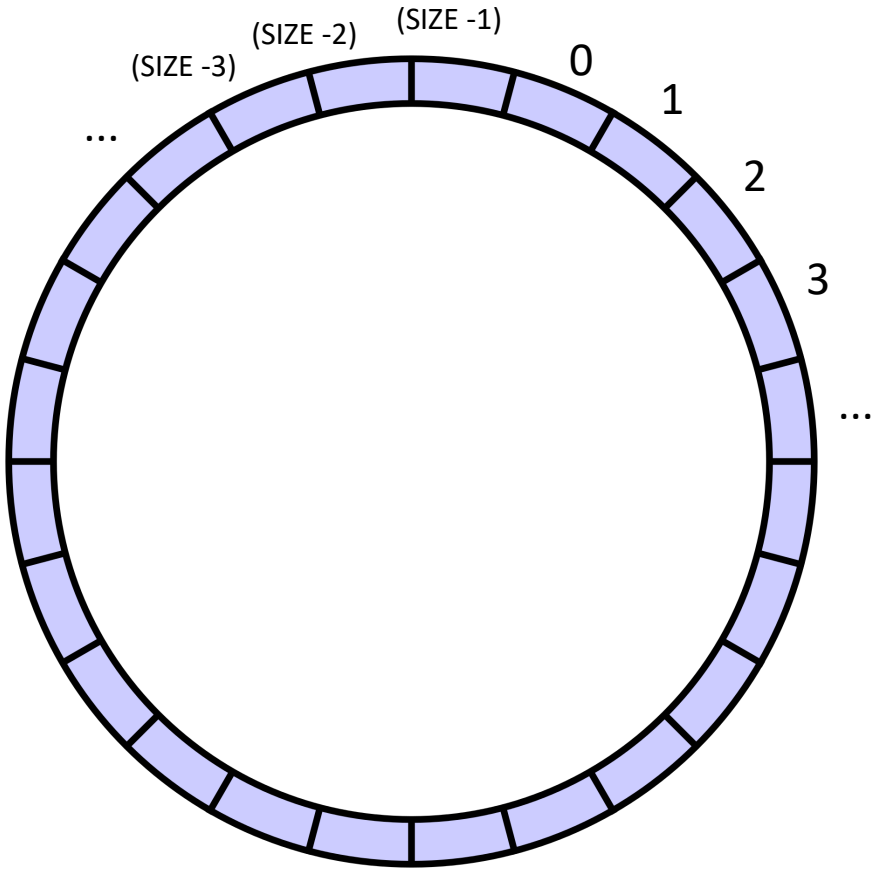
we will assume modular arithmetic:

if x = (SIZE - 1) then
x + 1 == 0;

conceptually it is a circle

Producer Consumer Queues

- Start with a fixed size array



indexes will circulate in order and wrap around

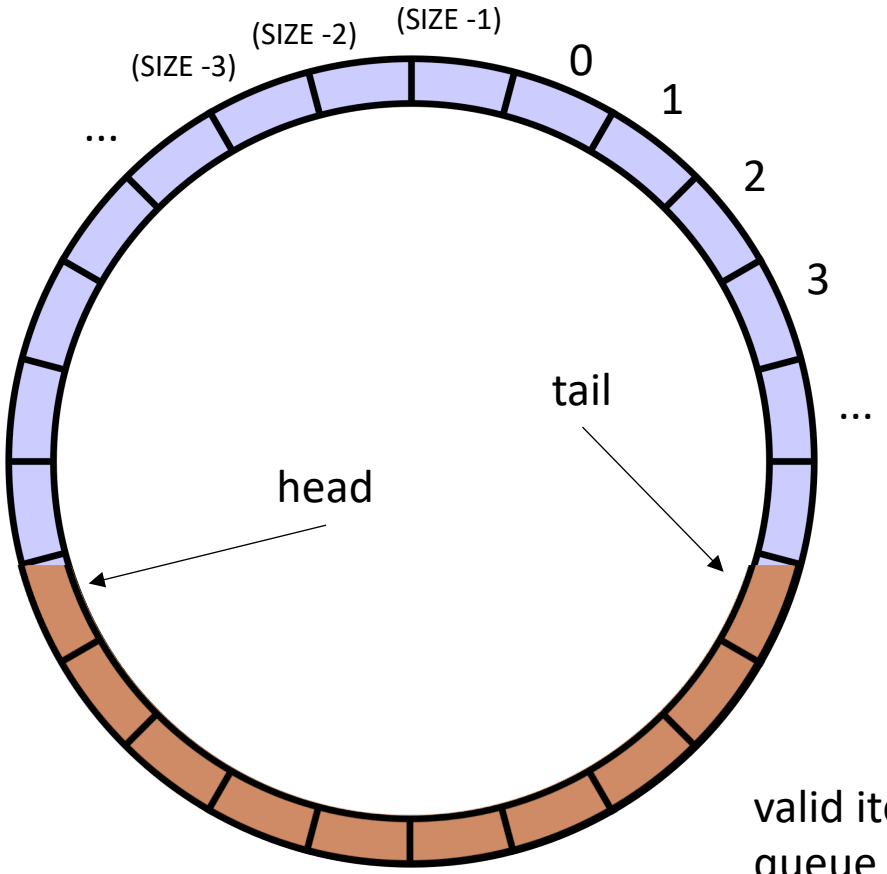
Two variables to keep track of where to deq and enq:

head and tail

conceptually it is a circle

Producer Consumer Queues

- Start with a fixed size array



indexes will circulate in order and wrap around

Two variables to keep track of where to deq and enq:

head and tail:

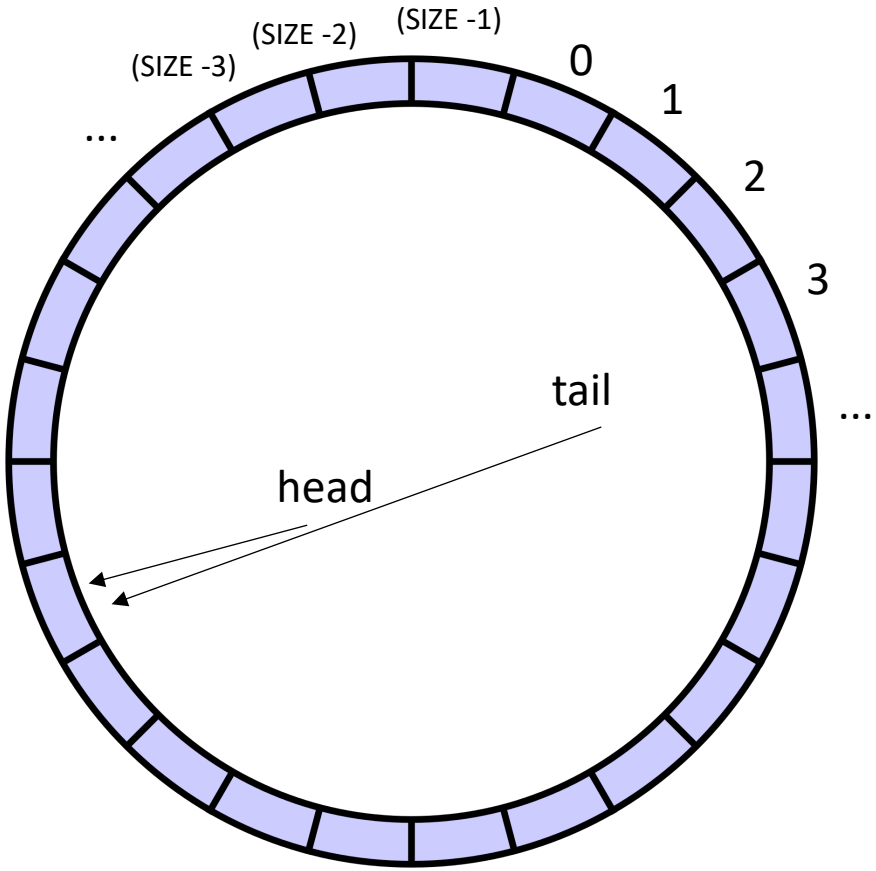
enq to the head, deq from the tail

valid items in the queue

conceptually it is a circle

Producer Consumer Queues

- Start with a fixed size array



indexes will circulate in order and wrap around

Two variables to keep track of where to deq and enq:

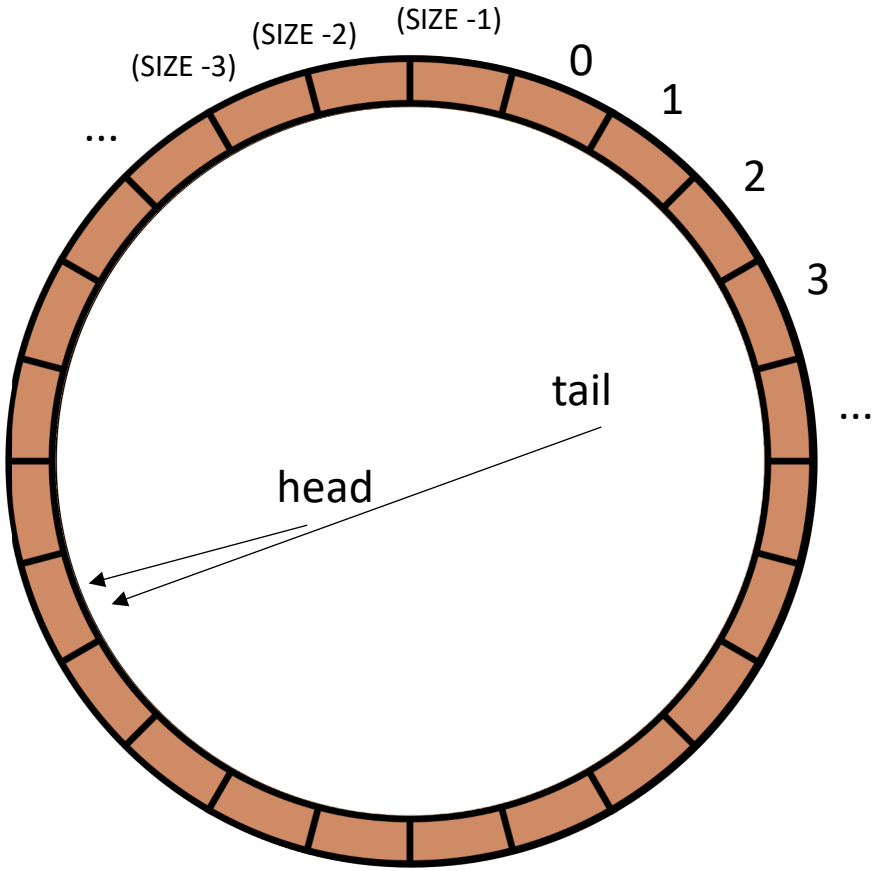
head and tail

Empty queue is when head == tail

conceptually it is a circle

Producer Consumer Queues

- Start with a fixed size array



indexes will circulate in order and wrap around

Two variables to keep track of where to deq and enq:

head and tail

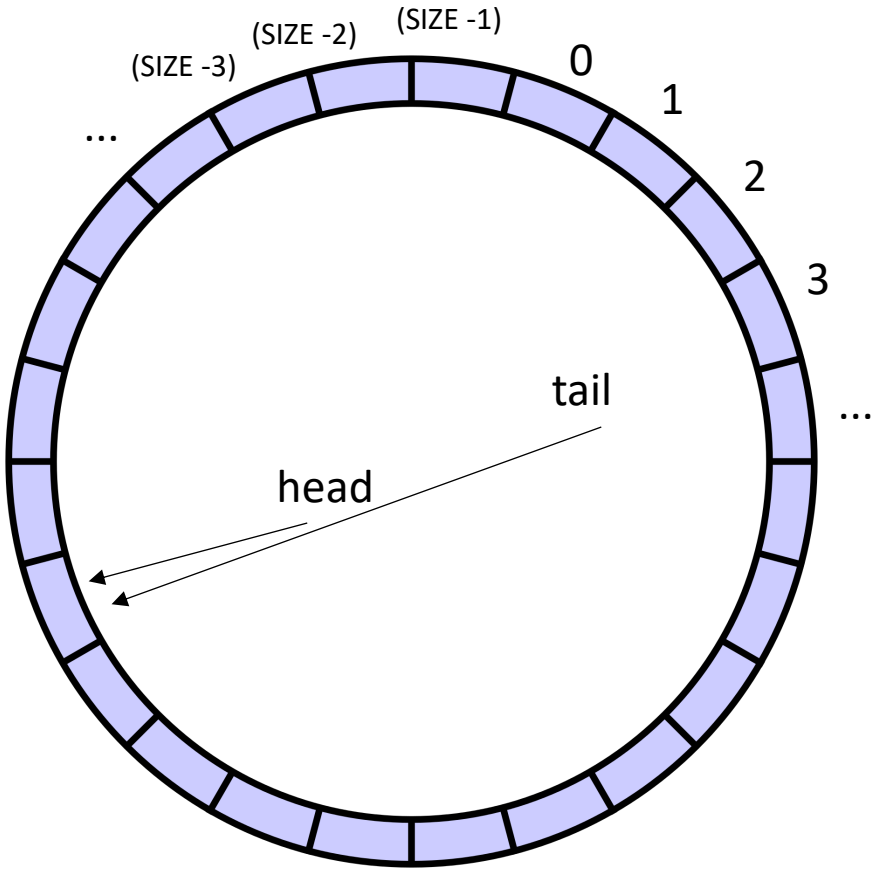
Empty queue is when
head == tail

Full queue is when
head == tail?

conceptually it is a circle

Producer Consumer Queues

- Start with a fixed size array



indexes will circulate in order and wrap around

Two variables to keep track of where to deq and enq:

head and tail

Empty queue is when
head == tail

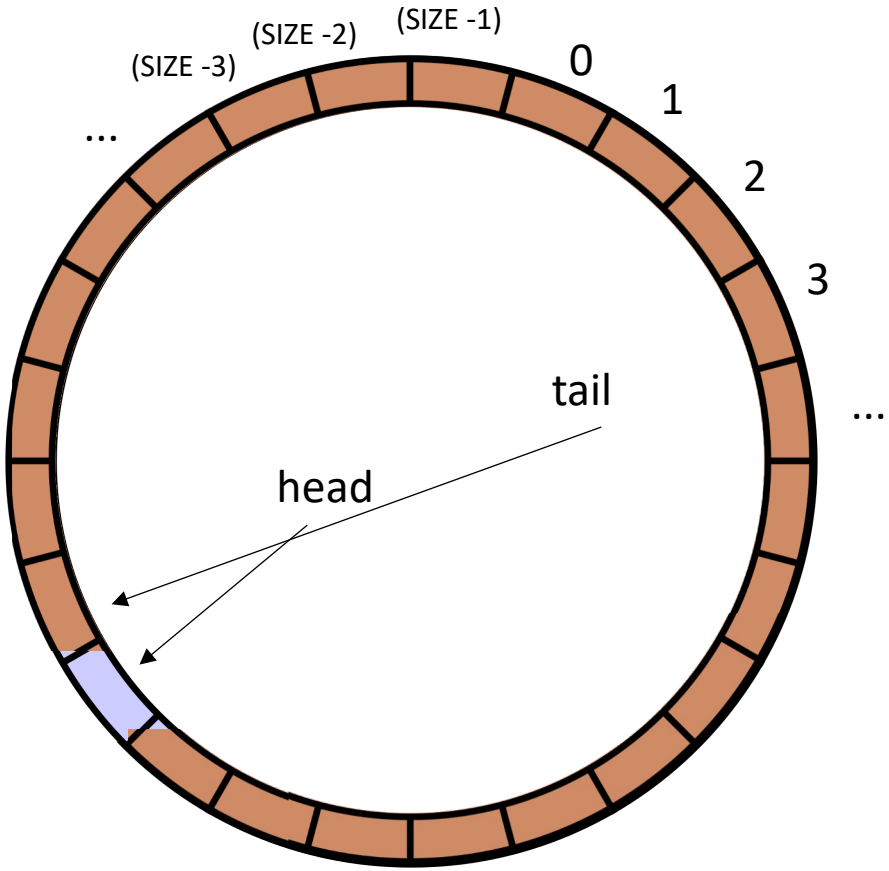
Full queue is when
head == tail?

but then
how to tell
full queue from
empty?

conceptually it is a circle

Producer Consumer Queues

- Start with a fixed size array



indexes will circulate in order and wrap around

Two variables to keep track of where to deq and enq:

head and tail

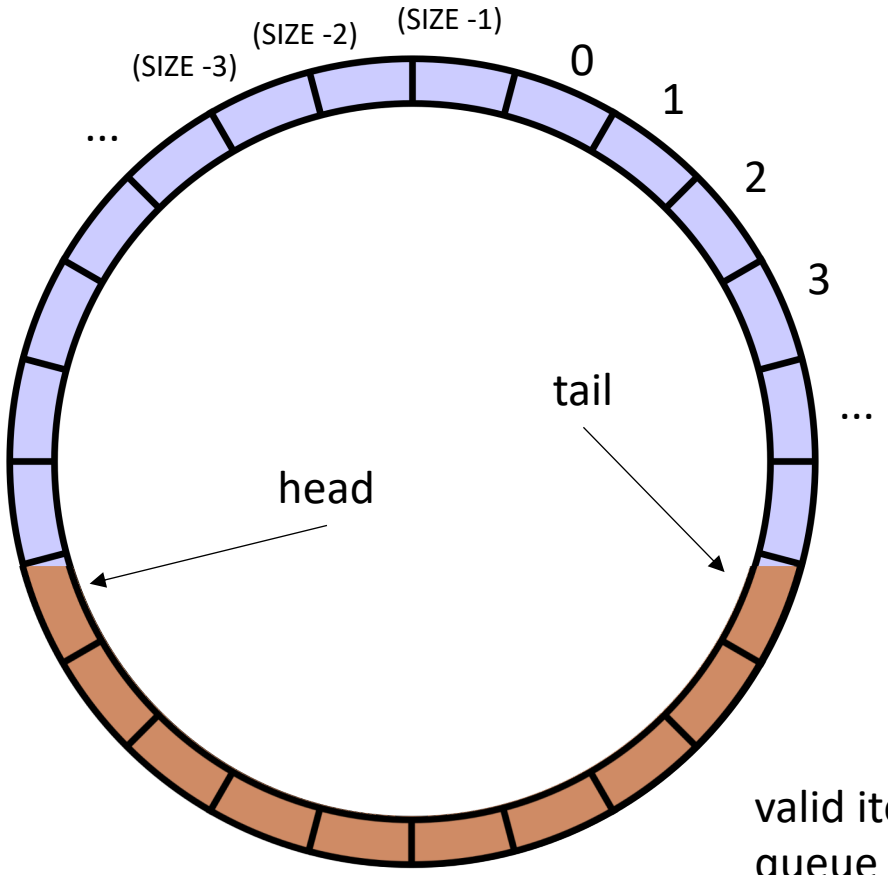
Empty queue is when
head == tail

Full queue is when
head + 1 == tail

wasting one location, but its okay...

conceptually it is a circle

review



valid items in the queue

```
class ProdConsQueue {
  private:
    atomic_int head;
    atomic_int tail;
    int buffer[SIZE];

  public:
    void enq(int x) {
      // wait for there to be room
      // store value at head
      // increment head
    }
    int deq() {
      // wait while queue is empty
      // get value at tail
      // increment tail
    }
}
```

On to new stuff!

- Work stealing

adds two arrays

```
for (int i = 0; i < SIZE; i++) {
  a[i] = b[i] + c[i];
}
```

adds elements with neighbors

```
for (int i = 0; i < SIZE; i++) {
  a[i] += a[i+1]
}
```

are they the same if you traverse them backwards?

adds two arrays

```
for (int i = 0; i < SIZE; i++) {
  a[i] = b[i] + c[i];
}
```

```
for (int i = SIZE-1; i >= 0; i--) {
  a[i] = b[i] + c[i];
}
```

adds elements with neighbors

```
for (int i = 0; i < SIZE; i++) {
  a[i] += a[i+1]
}
```

```
for (int i = SIZE-1; i >= 0; i--) {
  a[i] += a[i+1]
}
```

are they the same if you traverse them backwards?

adds two arrays

```
for (int i = 0; i < SIZE; i++) {
  a[i] = b[i] + c[i];
}
```

```
for (int i = SIZE-1; i >= 0; i--) {
  a[i] = b[i] + c[i];
}
```

adds elements with neighbors

```
for (int i = 0; i < SIZE; i++) {
  a[i] += a[i+1]
}
```

```
for (int i = SIZE-1; i >= 0; i--) {
  a[i] += a[i+1]
}
```

No!

adds two arrays

```
for (int i = 0; i < SIZE; i++) {
  a[i] = b[i] + c[i];
}
```

what about a random order?

```
for (pick i randomly) {
  a[i] = b[i] + c[i];
}
```

adds elements with neighbors

```
for (int i = 0; i < SIZE; i++) {
  a[i] += a[i+1]
}
```

```
for (pick i randomly) {
  a[i] += a[i+1]
}
```

adds two arrays

```
for (int i = 0; i < SIZE; i++) {
  a[i] = b[i] + c[i];
}
```

adds elements with neighbors

```
for (int i = 0; i < SIZE; i++) {
  a[i] += a[i+1]
}
```

what about a random order?

```
for (pick i randomly) {
  a[i] = b[i] + c[i];
}
```

```
for (pick i randomly) {
  a[i] += a[i+1]
}
```

No!

```
for (int i = 0; i < SIZE; i++) {
  a[i] = b[i] + c[i];
}
```

These are **DOALL** loops:

- Loop iterations are independent
- You can do them in ANY order and get the same results

```
for (int i = 0; i < SIZE; i++) {
  a[i] = b[i] + c[i];
}
```

These are **DOALL** loops:

- Loop iterations are independent
- You can do them in ANY order and get the same results

- Most importantly: you can do the iterations in parallel!
- Assign each thread a set of indices to compute

DOALL Loops

- Given a nest of For loops, can we make the outer-most loop parallel?
  - Safely
  - Efficiently

DOALL Loops

- We will consider a special type of for loop, common in scientific applications:
  - Operates on N dimensional arrays (only side-effects are array writes)
  - Array bases are disjoint and constant
  - Bounds, indexes are a function of loop variables, input variables and constants
  - Loops Increment by 1

```
for (int i = 0; i < dim1; i++) {
  for (int j = 0; j < dim3; j++) {
    for (int k = 0; k < dim2; k++) {
      a[i][j] += b[i][k] * c[k][j];
    }
  }
}
```

matrix multiplication example

DOALL Loops

- We will consider a special type of for loop, common in scientific applications:
  - Operates on N dimensional arrays (only side-effects are array writes)
  - Array bases are disjoint and constant
  - Bounds, indexes are a function of loop variables, input variables and constants
  - Loops Increment by 1 (optional). Transform to 1.

DOALL Loops

- Given a nest of ***candidate*** *For* loops, determine if we can we make the outer-most loop parallel?
  - Safely
  - efficiently

- Criteria: every iteration of the outer-most loop must be *independent*
  - The loop can execute in any order, and produce the same result

Safety Criteria

- How do we check this?
  - If the property doesn't hold then there exists 2 iterations, such that if they are re-ordered, it causes different outcomes for the loop.
  - **Write-Write conflicts**: two distinct iterations write different values to the same location
  - **Read-Write conflicts**: two distinct iterations where one iteration reads from the location written to by another iteration.

Safety Criteria

- Criteria: every iteration of the outer-most loop must be *independent*
- the loop must produce the same result for any order of the iterations

```
for (i = 0; i < size; i++) {
   a[index(i)] = loop(i);
}
```

Safety Criteria

- Criteria: every iteration of the outer-most loop must be *independent*
- the loop must produce the same result for any order of the iterations

```
for (i = 0; i < size; i++) {
   a[index(i)] = loop(i);
}
```

index calculation based on the loop variable

Safety Criteria

- Criteria: every iteration of the outer-most loop must be *independent*
- the loop must produce the same result for any order of the iterations

```
for (i = 0; i < size; i++) {
   a[index(i)] = loop(i);
}
```

index calculation based on the loop variable
Computation to store in the memory location

Safety Criteria

- Criteria: every iteration of the outer-most loop must be *independent*
- the loop must produce the same result for any order of the iterations

```
for (i = 0; i < size; i++) {
   a[index(i)] = loop(i);
}
```

Write-write conflicts:

for two distinct iteration variables:

i_x != i_y

Check:

index(i_x) != index(i_y)

Safety Criteria

- Criteria: every iteration of the outer-most loop must be *independent*
- the loop must produce the same result for any order of the iterations

```
for (i = 0; i < size; i++) {
   a[index(i)] = loop(i);
}
```

Write-write conflicts:

for two distinct iteration variables:
i_x != i_y
Check:
index(i_x) != index(i_y)

Why?
Because if
index(i_x) == index(i_y)
then:
a[index(i_x)] will equal
either loop(i_x) or loop(i_y)
depending on the order

Safety Criteria

- Criteria: every iteration of the outer-most loop must be *independent*

```
for (i = 0; i < size; i++) {
    a[write_index(i)] = a[read_index(i)] + loop(i);
}
```

Read-write conflicts:

for two distinct iteration variables:

i_x != i_y

Check:

write_index(i_x) != read_index(i_y)

Safety Criteria

- Criteria: every iteration of the outer-most loop must be *independent*

```
for (i = 0; i < size; i++) {
    a[write_index(i)] = a[read_index(i)] + loop(i);
}
```

Read-write conflicts:

for two distinct iteration variables:
i_x != i_y
Check:
write_index(i_x) != read_index(i_y)

Why?

if i_x iteration happens first, then iteration i_y reads an updated value.

if i_y happens first, then it reads the original value

Examples:

```
for (i = 0; i < 128; i++) {
   a[i]= a[i]*2;
}
```

Examples:

```
for (i = 0; i < 128; i++) {
   a[i]= a[i]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i]= a[0]*2;
}
```

Examples:

```
for (i = 0; i < 128; i++) {
   a[i]= a[i]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i]= a[0]*2;
}
```

```
for (i = 1; i < 128; i++) {
   a[i]= a[0]*2;
}
```

Examples:

```
for (i = 0; i < 128; i++) {
   a[i]= a[i]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i]= a[0]*2;
}
```

```
for (i = 1; i < 128; i++) {
   a[i]= a[0]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i%64]= a[i]*2;
}
```

Examples:

```
for (i = 0; i < 128; i++) {
   a[i]= a[i]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i]= a[0]*2;
}
```

```
for (i = 1; i < 128; i++) {
   a[i]= a[0]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i%64]= a[i]*2;
}
```

```
i1 = 0,  i2 = 1 both writing to 0
```

Examples:

```
for (i = 0; i < 128; i++) {
   a[i]= a[i]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i]= a[0]*2;
}
```

```
for (i = 1; i < 128; i++) {
   a[i]= a[0]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i%64]= a[i]*2;
}
```

```
for (i = 0; i < 128; i++) {
   a[i%64]= a[i+64]*2;
}
```

Parallel Schedules

- Consider the following program:

There are 3 arrays: `a, b, c.`

We want to compute:

```
for (int i = 0; i < SIZE; i++) {
  c[i] = a[i] + b[i];
}
```

Is this a DOALL loop?

Parallel Schedules

- Consider the following program:

There are 3 arrays: `a, b, c.`

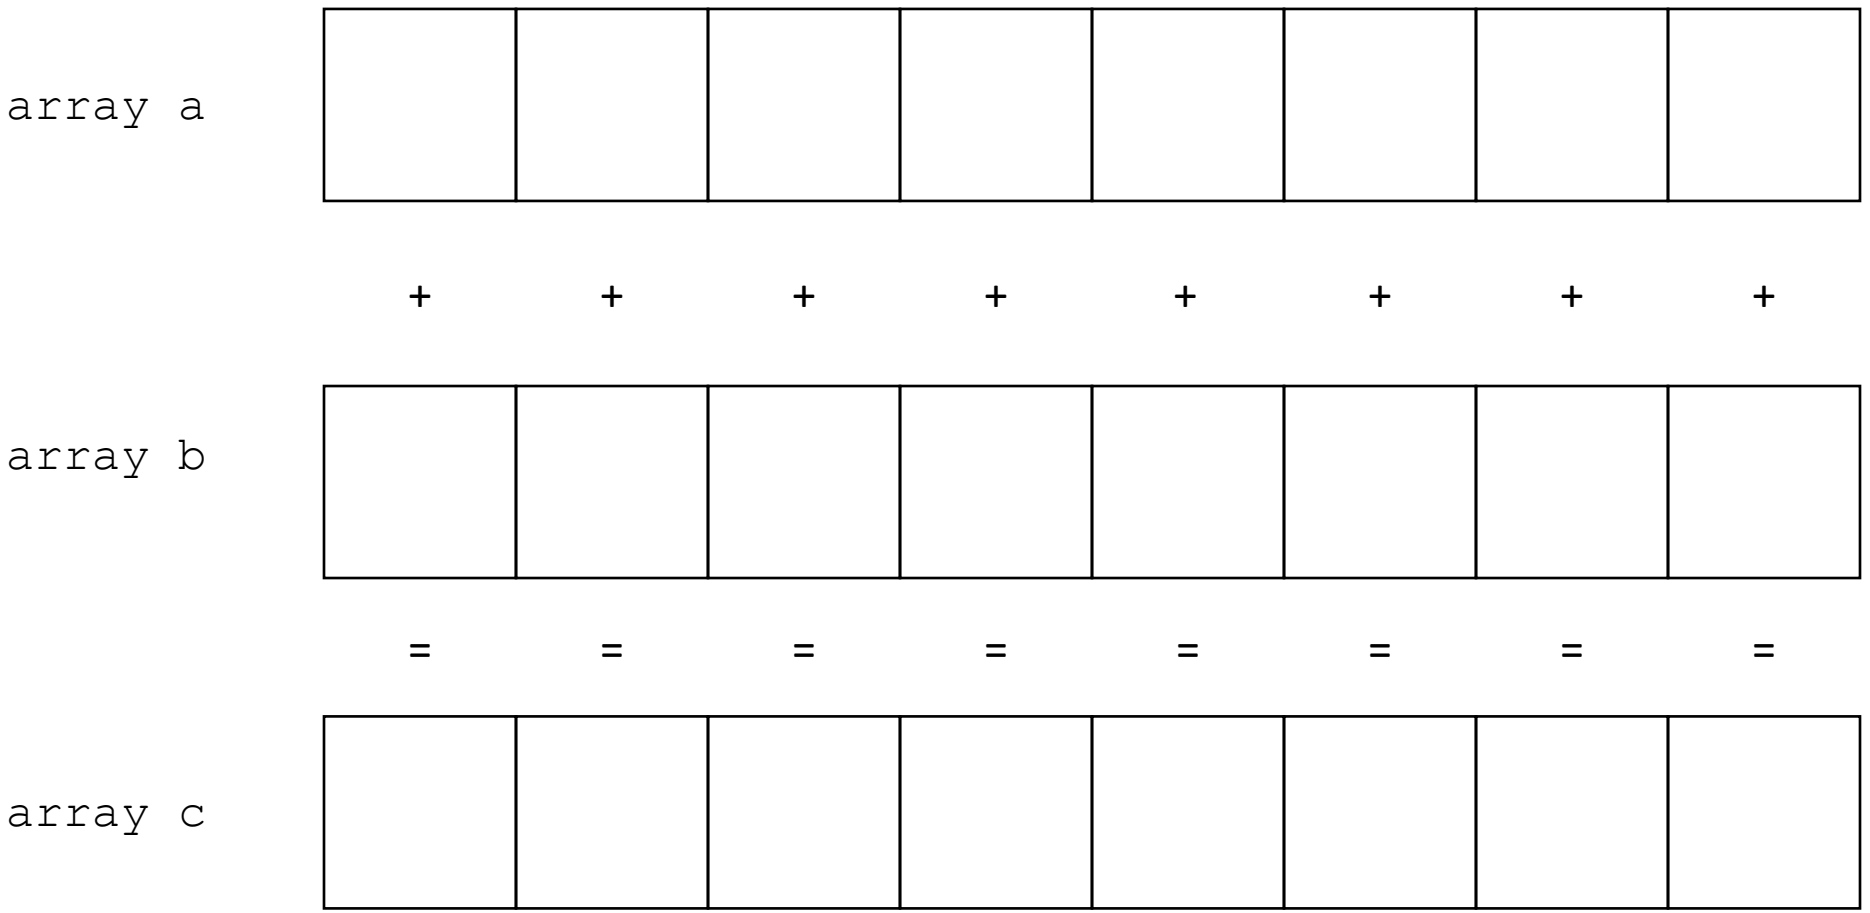
We want to compute:

```
for (int i = 0; i < SIZE; i++) {
  c[i] = a[i] + b[i];
}
```

Is this a DOALL loop?

How should we parallelize it?

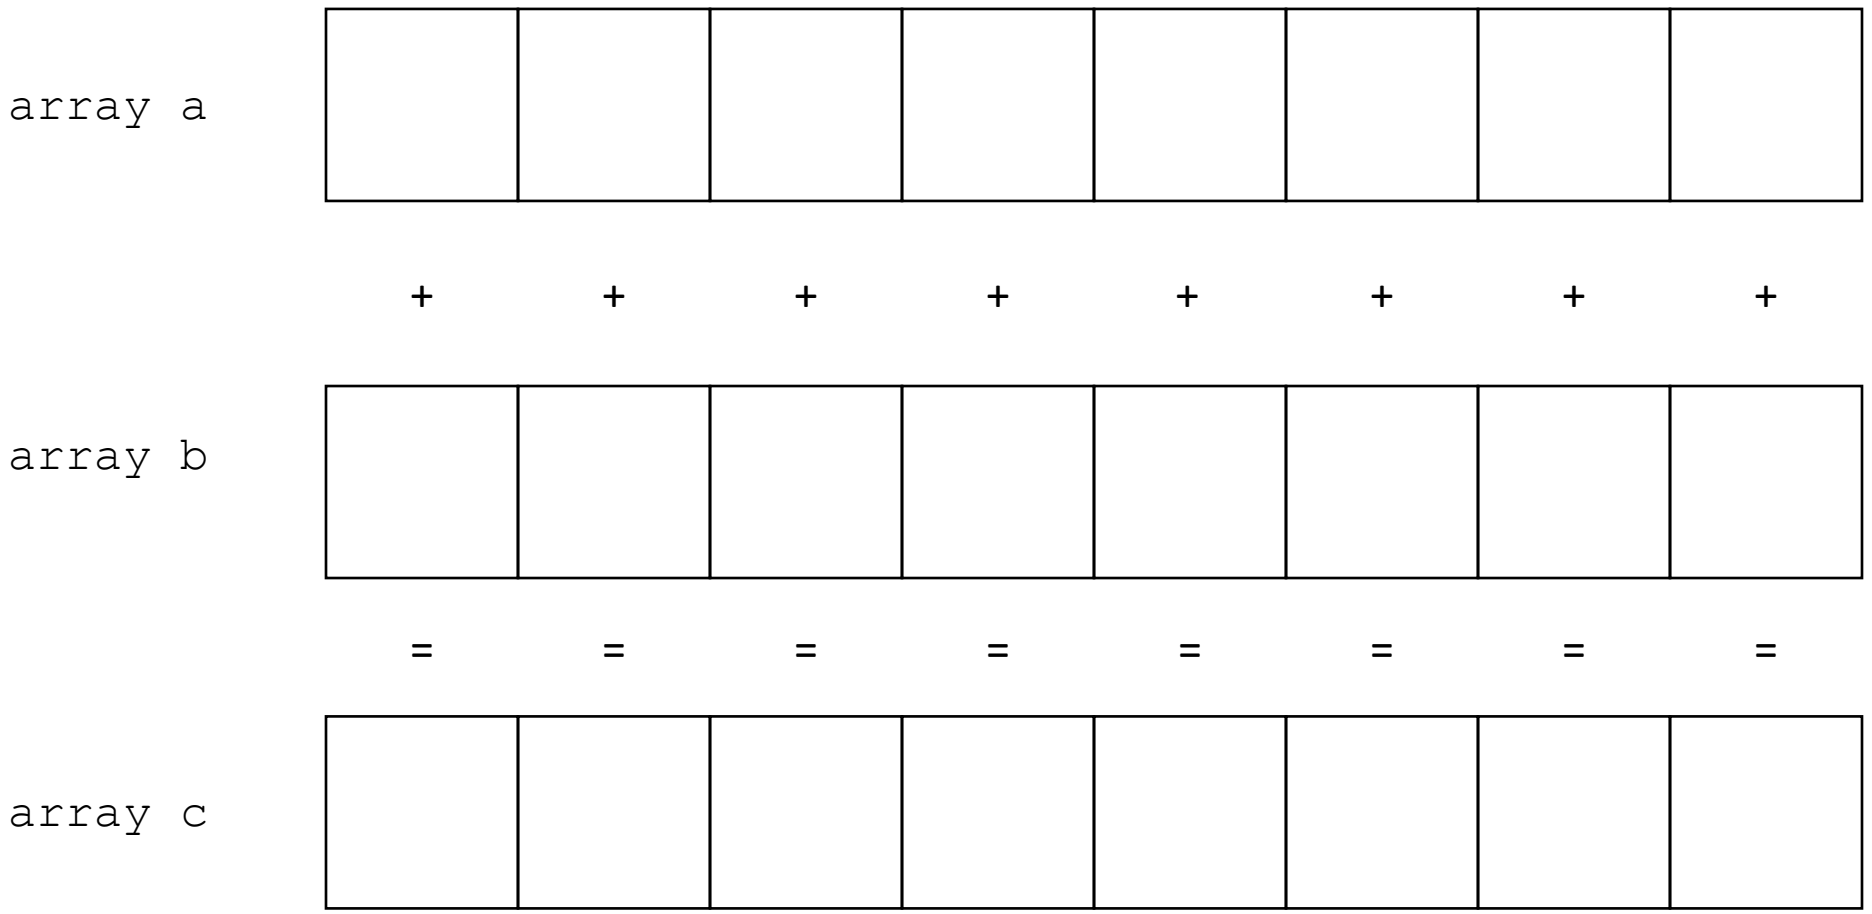
Parallel Schedules



Parallel Schedules

Computation can easily be divided into threads

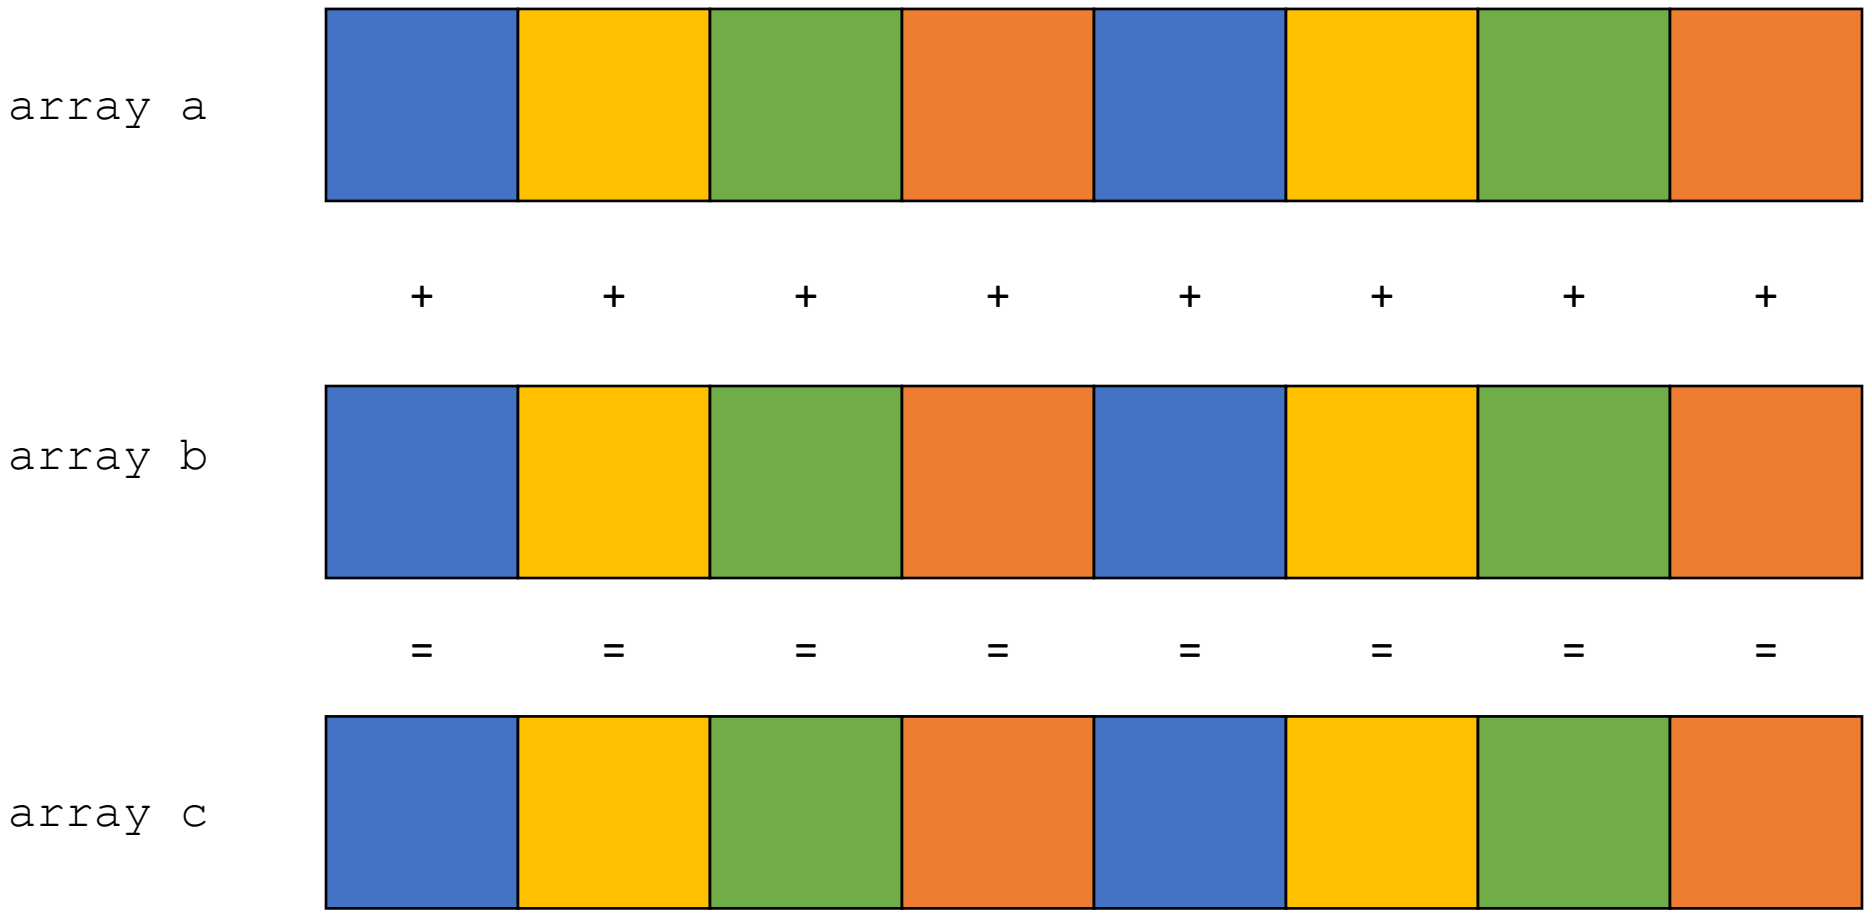
Thread 0 - Blue
Thread 1 - Yellow
Thread 2 - Green
Thread 3 - Orange



Parallel Schedules

Computation can easily be divided into threads

Thread 0 - Blue
Thread 1 - Yellow
Thread 2 - Green
Thread 3 - Orange



Parallel Schedules

Computation can easily be divided into threads

Thread 0 - Blue
Thread 1 - Yellow
Thread 2 - Green

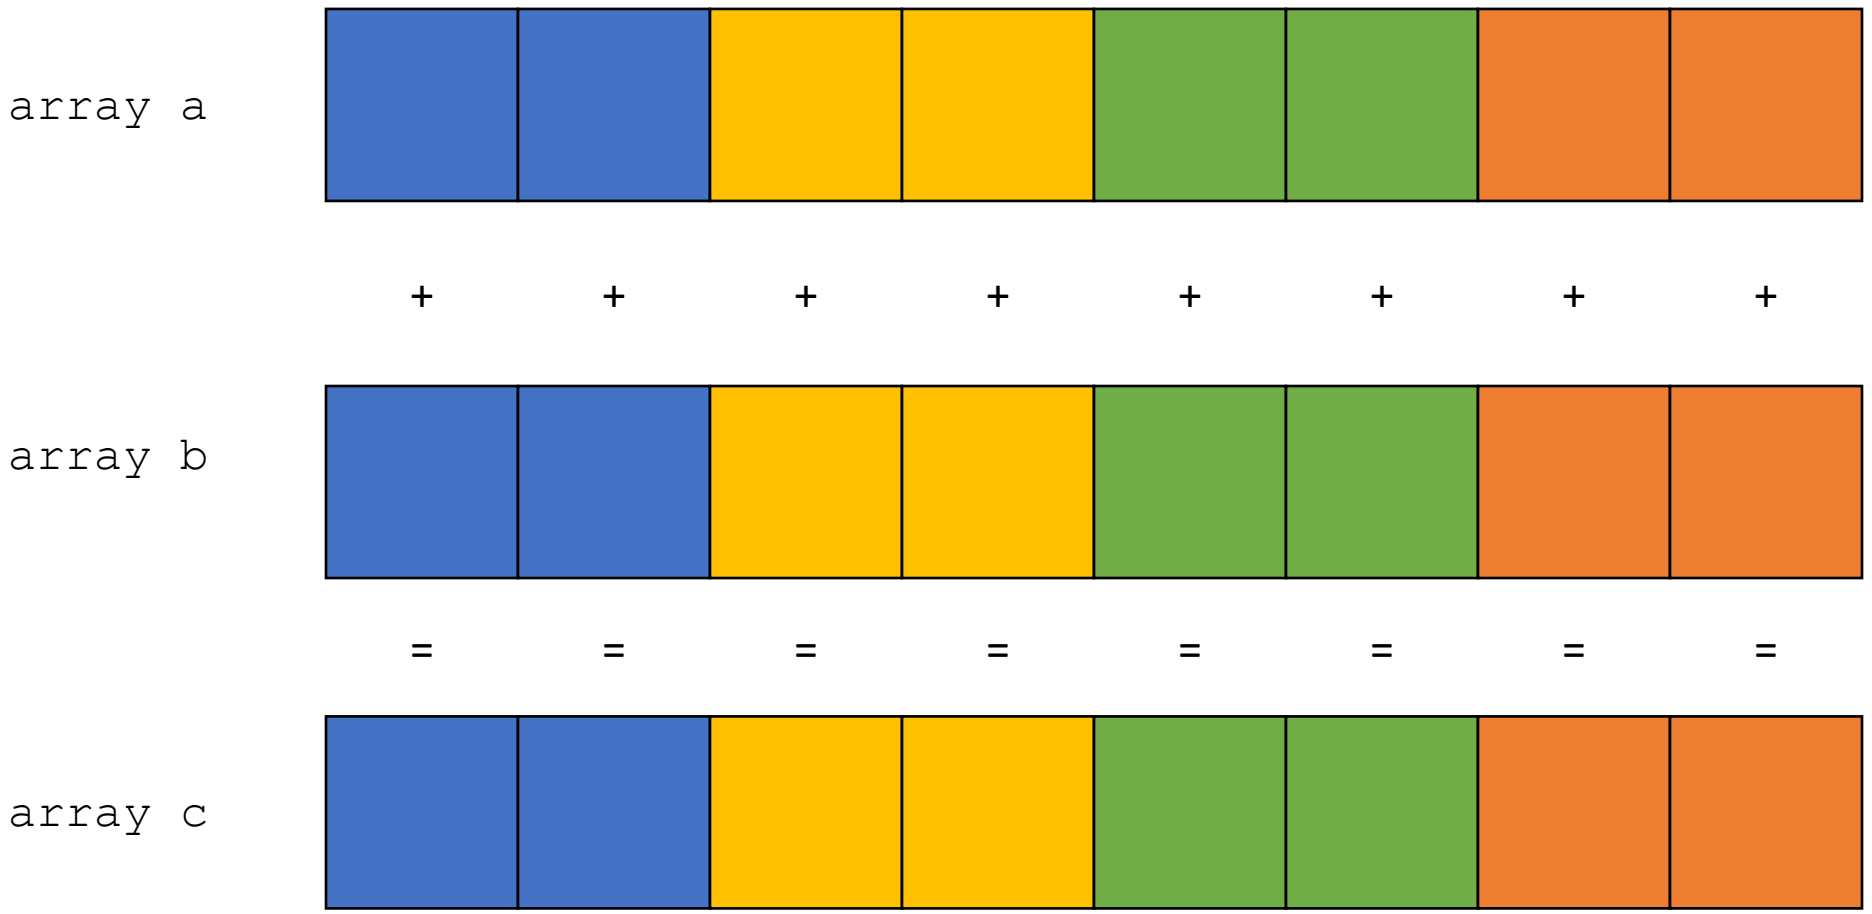
Parallel Schedules

Computation can easily be divided into threads

Thread 0 - Blue
Thread 1 - Yellow
Thread 2 - Green
Thread 3 - Orange



Parallel Schedules

- Which one is more efficient?

Parallel Schedules

- Which one is more efficient? Avoid false sharing.

Parallel Schedules

- Which one is more efficient?

- These are called Parallel Schedules for DOALL Loops
- We will discuss several of them.

Schedule

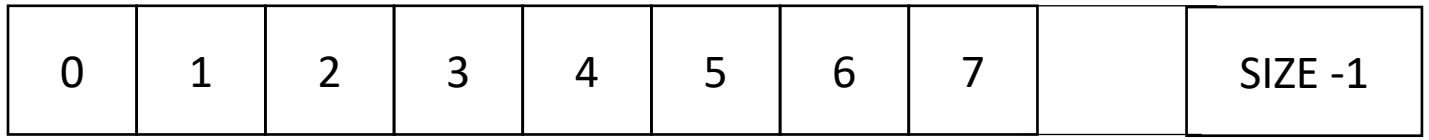
- DOALL Loops

- **Parallel Schedules:**
  - **Static**
  - Global Worklists
  - Local Worklists

Static schedule

- Works well when loop iterations take similar amounts of time

```
void foo() {
...
  for (int x = 0; x < SIZE; x++) {
  // Each iteration takes roughly
  // equal time
  }
...
}
```

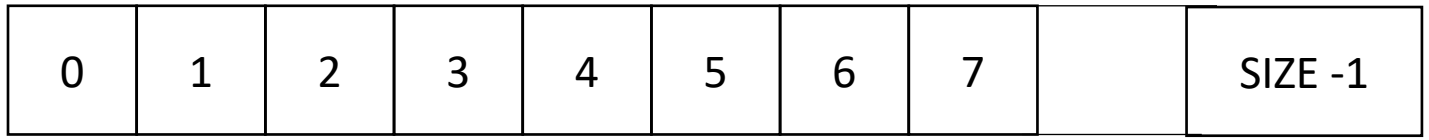


Static schedule

- Works well when loop iterations take similar amounts of time

```
void foo() {
...
  for (int x = 0; x < SIZE; x++) {
  // Each iteration takes roughly
  // equal time
  }
...
}
```

say SIZE / NUM_THREADS = 4

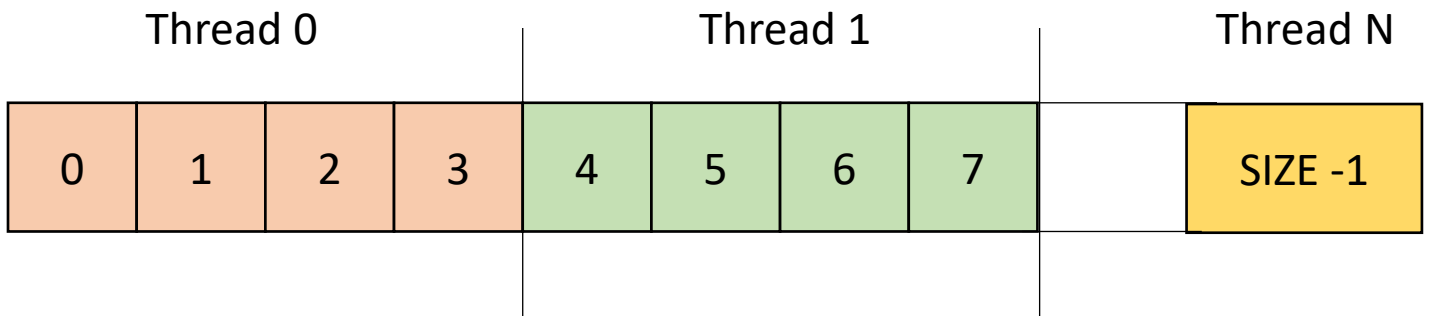


Static schedule

- Works well when loop iterations take similar amounts of time

```
void foo() {
...
  for (int x = 0; x < SIZE; x++) {
  // Each iteration takes roughly
  // equal time
  }
...
}
```

say SIZE / NUM_THREADS = 4



Static schedule

- Works well when loop iterations take similar amounts of time

```
void foo() {
...
  for (int x = 0; x < SIZE; x++) {
  // Each iteration takes roughly
  // equal time
  }
...
}
```

make a new function with the for loop inside. Pass all needed variables as arguments. Take an extra argument for a thread id

Static schedule

- Works well when loop iterations take similar amounts of time

```
void foo() {
...
  for (int x = 0; x < SIZE; x++) {
  // Each iteration takes roughly
  // equal time
  }
...
}
```

```
void parallel_loop(..., int tid, int num_threads)
{

  for (int x = 0; x < SIZE; x++) {
    // work based on x
  }
}
```

make a new function with the for loop inside. Pass all needed variables as arguments. Take an extra argument for a thread id

Static schedule

- Works well when loop iterations take similar amounts of time

```
void foo() {
...
  for (int x = 0; x < SIZE; x++) {
  // Each iteration takes roughly
  // equal time
  }
...
}
```

```
void parallel_loop(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  for (int x = 0; x < SIZE; x++) {
    // work based on x
  }
}
```

determine chunk size in new function

Static schedule

- Works well when loop iterations take similar amounts of time

```
void foo() {
...
  for (int x = 0; x < SIZE; x++) {
  // Each iteration takes roughly
  // equal time
  }
...
}
```

```
void parallel_loop(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Set new loop bounds

Static schedule

- Works well when loop iterations take similar amounts of time

```
void foo() {
...
  for (int t = 0; t < NUM_THREADS; t++) {
    spawn(parallel_loop(..., t, NUM_THREADS))
  }
  join();
...
}
```

```
void parallel_loop(..., int tid, int num_threads)
{

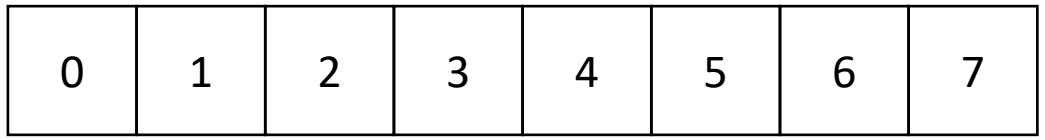
  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

You will need to adapt the thread spawn, join to C++

Spawn threads

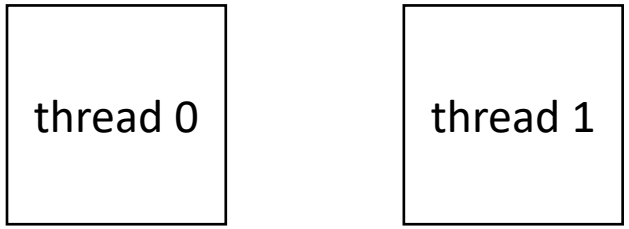
Static schedule

- Example, 2 threads/cores, array of size 8



```
chunk_size = ?

0: start = ?    1: start = ?
0: end = ?      1: end = ?
```

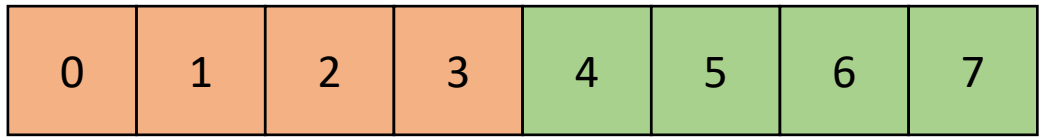


```
void parallel_loop(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

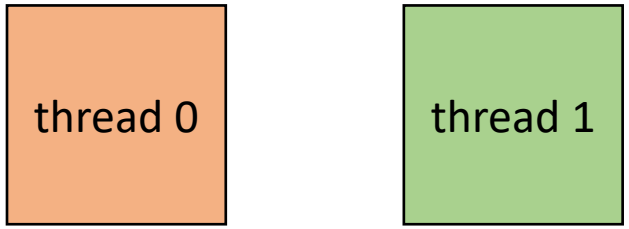
Static schedule

- Example, 2 threads/cores, array of size 8



```
chunk_size = 4
```

```
0: start = 0    1: start = 4
0: end = 4      1: end = 8
```

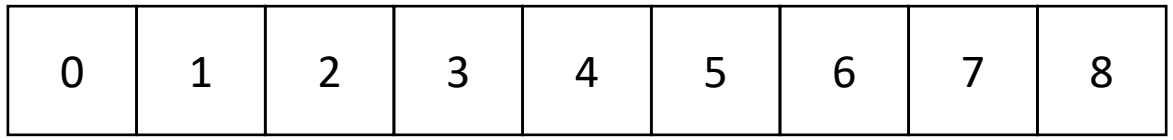


```
void parallel_loop(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

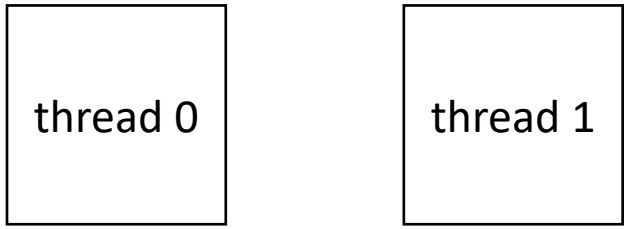
Static schedule

- Example, 2 threads/cores, array of size 9



```
chunk_size = ?

0: start = ?    1: start = ?
0: end = ?      1: end = ?
```

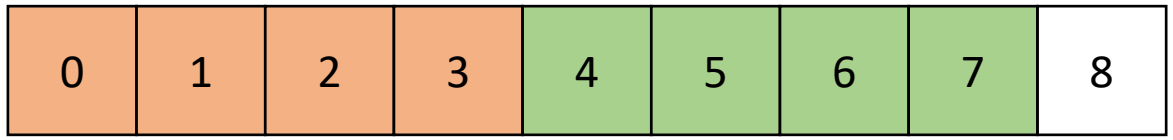


```
void parallel_loop(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

- Example, 2 threads/cores, array of size 9



```
chunk_size = 4
```

```
0: start = 0
0: end = 4
```

```
1: start = 4
1: end = 8
```

thread 0

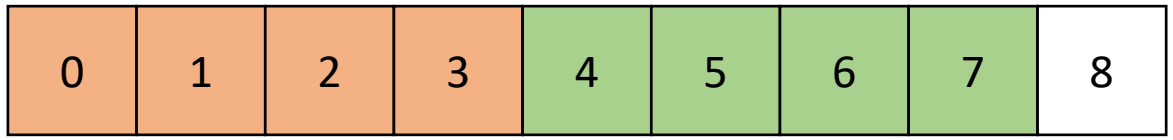
thread 1

```
void parallel_loop(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

- Example, 2 threads/cores, array of size 9



```
chunk_size = 4
```

```
0: start = 0    1: start = 4
0: end = 4      1: end = 8
```

```
void parallel_loop(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  if (tid == num_threads - 1) {
    end = SIZE;
  }
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

last thread gets more work

- Example, 2 threads/cores, array of size 9

```
chunk_size = 4
```

```
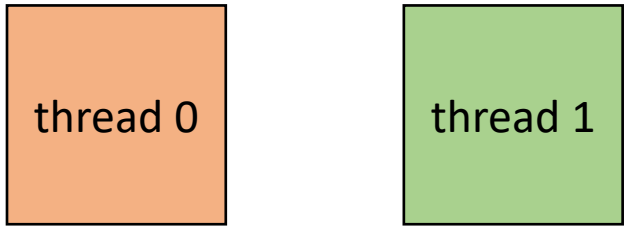
0: start = 0    1: start = 4
0: end = 4      1: end = ?
```



```
void parallel_loop(..., int tid, int num_threads)
{

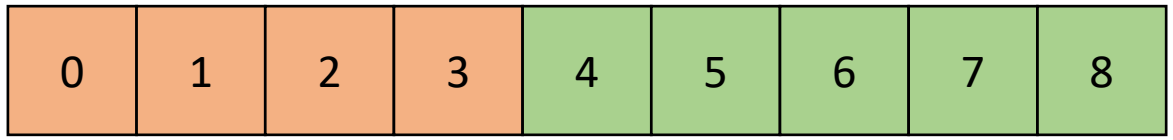
  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  if (tid == num_threads - 1) {
    end = SIZE;
  }
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

- Example, 2 threads/cores, array of size 9

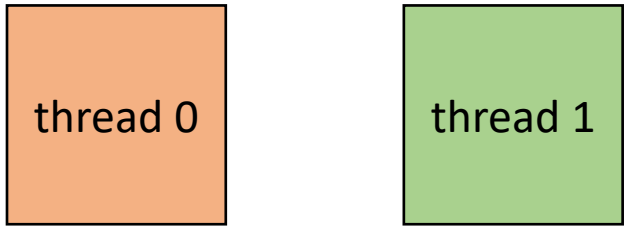
last thread gets more work

What is the worst case?



```
chunk_size = 4
```

```
0: start = 0    1: start = 4
0: end = 4      1: end = 9
```



```
void parallel_loop(..., int tid, int num_threads)
{

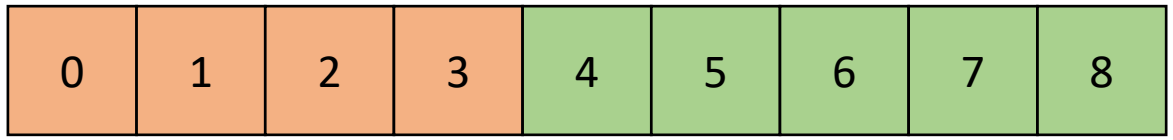
  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  if (tid == num_threads - 1) {
    end = SIZE;
  }
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

- Example, 2 threads/cores, array of size 9

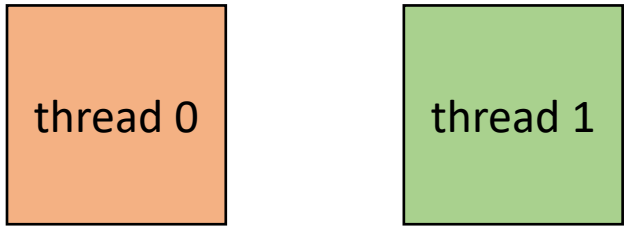
last thread gets more work

What is the worst case?
3 items



```
chunk_size = 4

0: start = 0    1: start = 4
0: end = 4      1: end = 9
```

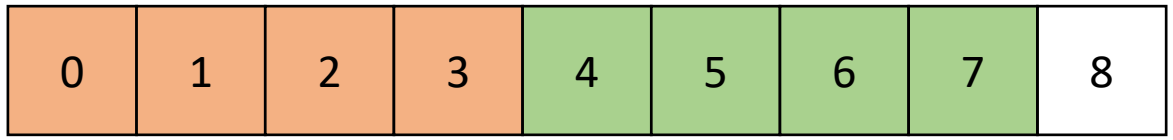


```
void parallel_loop(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  if (tid == num_threads - 1) {
    end = SIZE;
  }
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

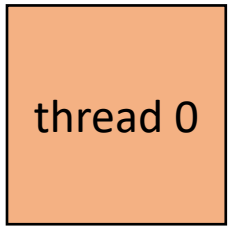
- Example, 2 threads/cores, array of size 9



```
chunk_size = 4
```

```
0: start = 0
0: end = 4
```

```
1: start = 4
1: end = 8
```



ceiling division, this will distribute uneven work in the last thread to all other threads

```
void parallel_loop(..., int tid, int num_threads)
{
  int chunk_size =
   (SIZE+(NUM_THREADS-1))/NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

- Example, 2 threads/cores, array of size 9

out of bounds

```
chunk_size = 5
```

```
0: start = 0
0: end = 5
```

```
1: start = 5
1: end = 10
```

thread 0

thread 1

```
void parallel_loop(..., int tid, int num_threads)
{
  int chunk_size =
   (SIZE+(NUM_THREADS-1))/NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

- Example, 2 threads/cores, array of size 9

out of bounds

```
chunk_size = 5
```

```
0: start = 0
0: end = 5
```

```
1: start = 5
1: end = 10
```

thread 0

thread 1

```
void parallel_loop(..., int tid, int num_threads)
{
  int chunk_size =
   (SIZE+(NUM_THREADS-1))/NUM_THREADS;
  int start = chunk_size * tid;
  int end =
   min(start+chunk_size, SIZE)
for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Static schedule

- Example, 2 threads/cores, array of size 9

```
chunk_size = 5
```

```
0: start = 0
0: end = 5
```

```
1: start = 5
1: end = 9
```

thread 0

thread 1

most threads do equal amounts of work, last thread may do less.

Which one is better/worse?
Approach 1:
Max slowdown for last thread does all the extra work? 3 items
Approach 2: (with ceiling)
Max slowdown is 1 item.

```
void parallel_loop(..., int tid, int num_threads)
{
  int chunk_size =
   (SIZE+(NUM_THREADS-1))/NUM_THREADS;
  int start = chunk_size * tid;
  int end =
   min(start+chunk_size, SIZE)
for (int x = start; x < end; x++) {
    // work based on x
  }
}
```

Schedule

- DOALL Loops

- **Parallel Schedules:**
  - Static
  - **Global Worklists**
  - Local Worklists

Irregular parallelism in loops

- Tasks are not balanced
- Appears in lots of emerging workloads

Irregular parallelism in loops

- Tasks are not balanced
- Appears in lots of emerging workloads

social network analytics where threads are parallel across users

Irregular parallelism in loops

- Independent iterations have different amount of work to compute
- Threads with longer tasks take longer to compute.
- Threads with shorter tasks are under utilized.

```
for (x = 0; x < SIZE; x++) {
  for (y = x; y < SIZE; y++) {
    a[x,y] = b[x,y] + c[x,y];
  }
}
```

irregular (or unbalanced) parallelism: each x iteration performs different amount of work.

Irregular parallelism in loops

- Calculate imbalance cost if x is chunked:
  - Thread 1 takes iterations 0 - SIZE/2
  - Thread 2 takes iterations SIZE/2 - SIZE

```
for (x = 0; x < SIZE; x++) {
  for (y = x; y < SIZE; y++) {
    a[x,y] = b[x,y] + c[x,y];
  }
}
```

Irregular parallelism in loops

- Calculate imbalance cost if x is chunked:
  - Thread 1 takes iterations 0 - SIZE/2
  - Thread 2 takes iterations SIZE/2 - SIZE

Calculate how much total work:

$$\text{total\_work} = \sum_{n=0}^{SIZE} n$$

```
for (x = 0; x < SIZE; x++) {
  for (y = x; y < SIZE; y++) {
    a[x,y] = b[x,y] + c[x,y];
  }
}
```

Irregular parallelism in loops

- Calculate imbalance cost if x is chunked:
  - Thread 1 takes iterations 0 - SIZE/2
  - Thread 2 takes iterations SIZE/2 - SIZE

```
for (x = 0; x < SIZE; x++) {
  for (y = x; y < SIZE; y++) {
    a[x,y] = b[x,y] + c[x,y];
  }
}
```

Calculate how much total work:

$$\text{total\_work} = \sum_{n=0}^{SIZE} n$$

Calculate work done by first thread:

$$\text{t1\_work} = \sum_{n=0}^{SIZE/2} n$$

Irregular parallelism in loops

- Calculate imbalance cost if x is chunked:
  - Thread 1 takes iterations 0 - SIZE/2
  - Thread 2 takes iterations SIZE/2 - SIZE

```
for (x = 0; x < SIZE; x++) {
  for (y = x; y < SIZE; y++) {
    a[x,y] = b[x,y] + c[x,y];
  }
}
```

Calculate how much total work:

$$\text{total\_work} = \sum_{n=0}^{SIZE} n$$

Calculate work done by first thread:

$$\text{t1\_work} = \sum_{n=0}^{SIZE/2} n$$

Calculate work work done by second thread:

t2_work = total_work − t1_work

Irregular parallelism in loops

Example: SIZE = 64

total_work = 2016
t2_work = 496
t1_work = 1520

t1 does ~3x more work than t2

Only provides ~1.3x speedup

Potential solution:
Have T1 do only ¼ of the iterations
Gives a better speedup of 1.77x

Not a feasible solution because often times load imbalance is not given by a static equation on loop bounds!

Calculate how much total work:

$$\text{total\_work} = \sum_{n=0}^{SIZE} n$$

Calculate work done by first thread:

$$\text{t1\_work} = \sum_{n=0}^{SIZE/2} n$$

Calculate work work done by second thread:

t2_work = total_work − t1_work

Work stealing

- Tasks are dynamically assigned to threads.

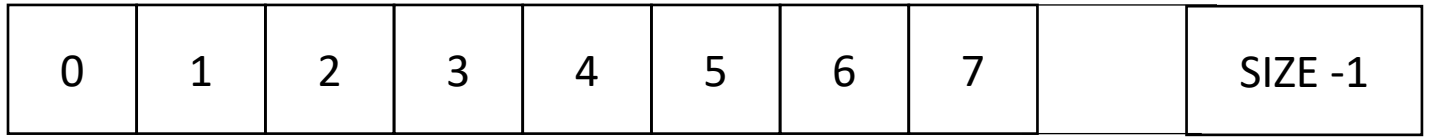
Work stealing - global implicit worklist

- Pros
  - Simple to implement

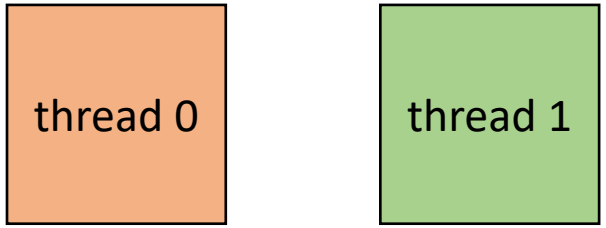
- Cons:
  - High contention on global counter
  - Potentially bad memory locality.

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically

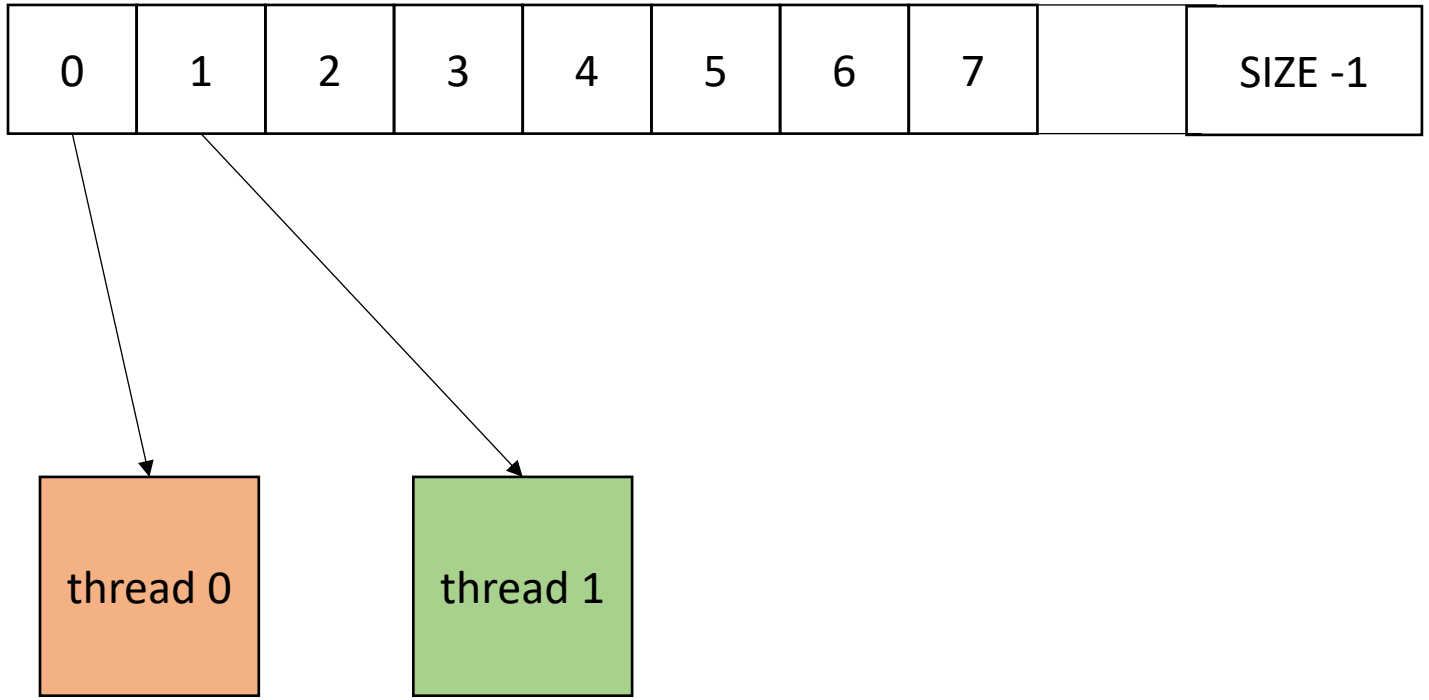


cannot color initially!



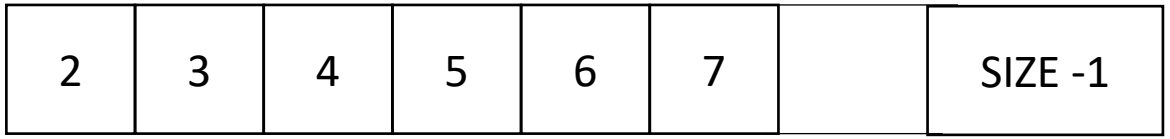
Work stealing - global implicit worklist

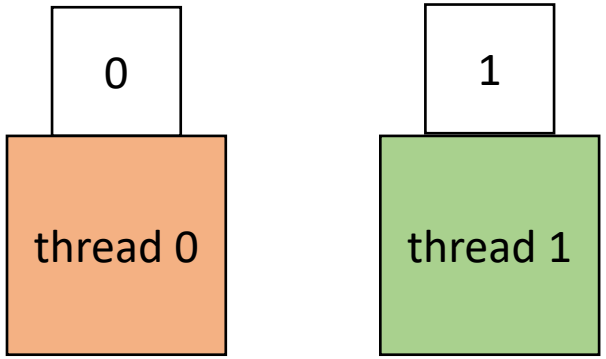
- Global worklist: threads take tasks (iterations) dynamically



Work stealing - global implicit worklist

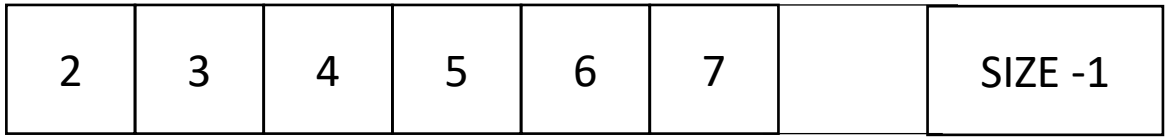
- Global worklist: threads take tasks (iterations) dynamically

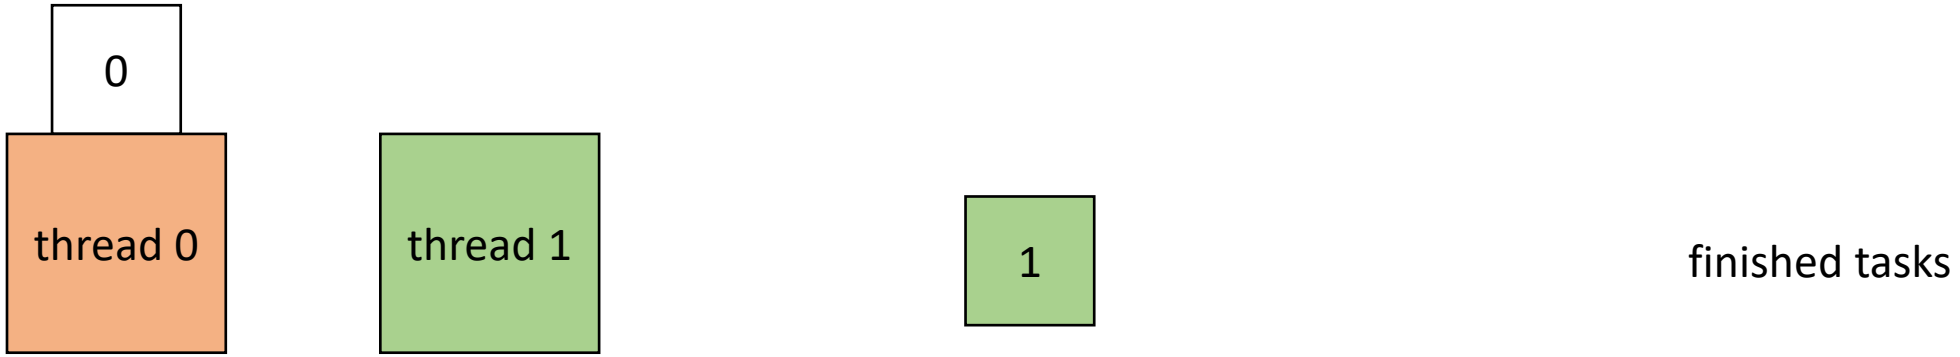




Work stealing - global implicit worklist

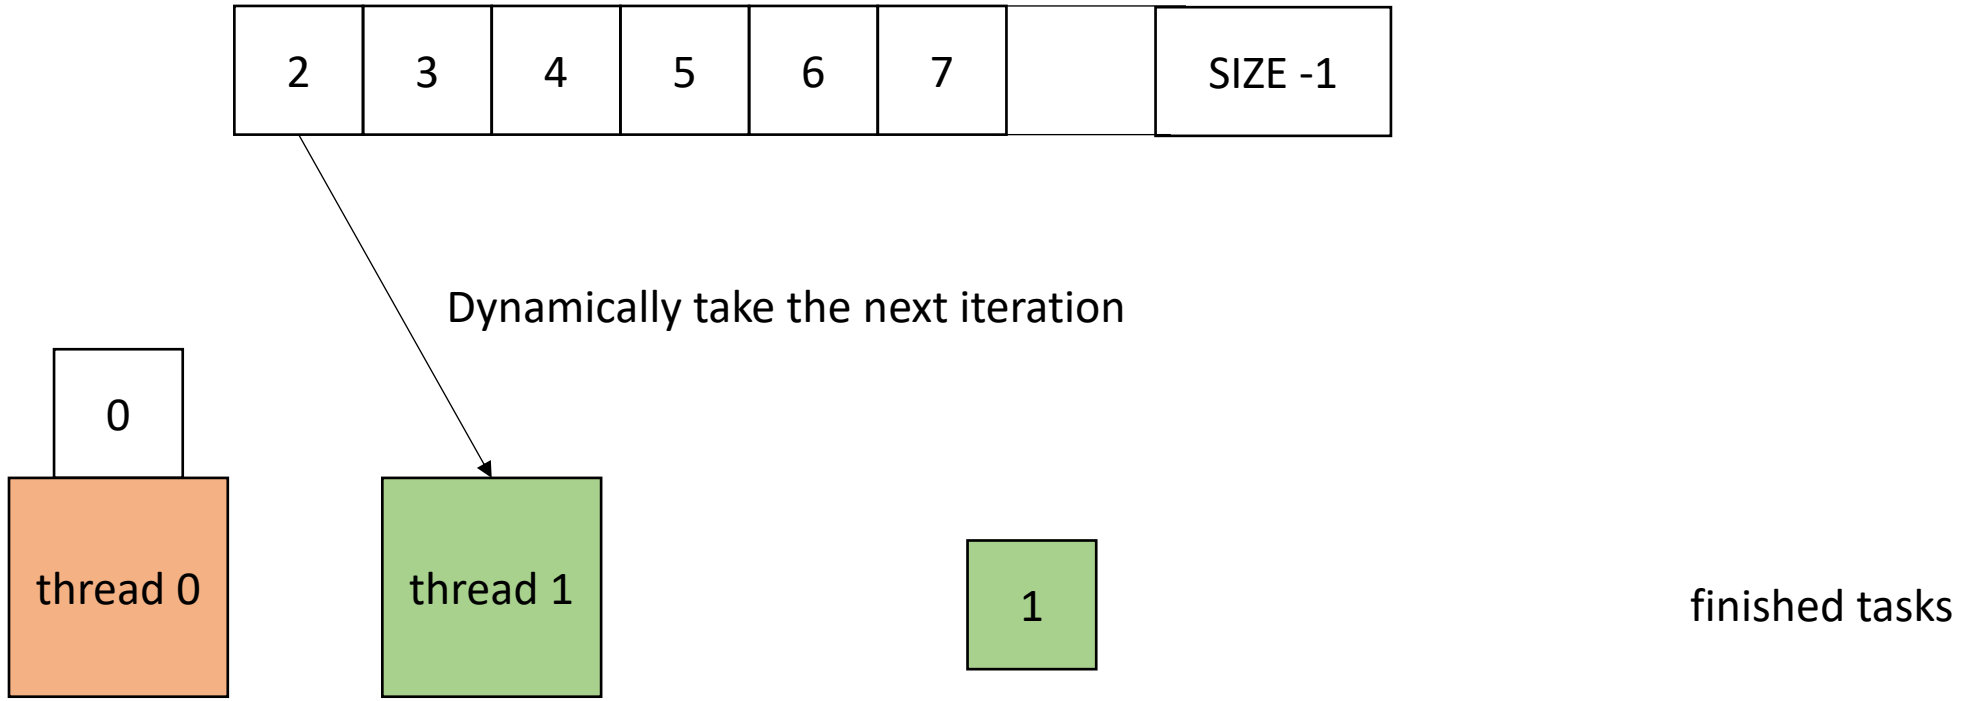
- Global worklist: threads take tasks (iterations) dynamically





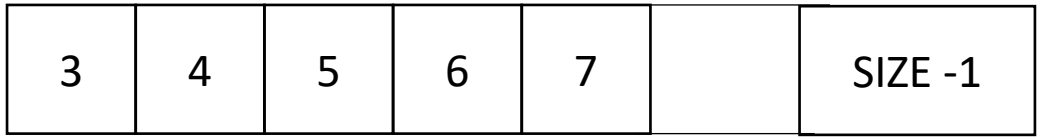
Work stealing - global implicit worklist

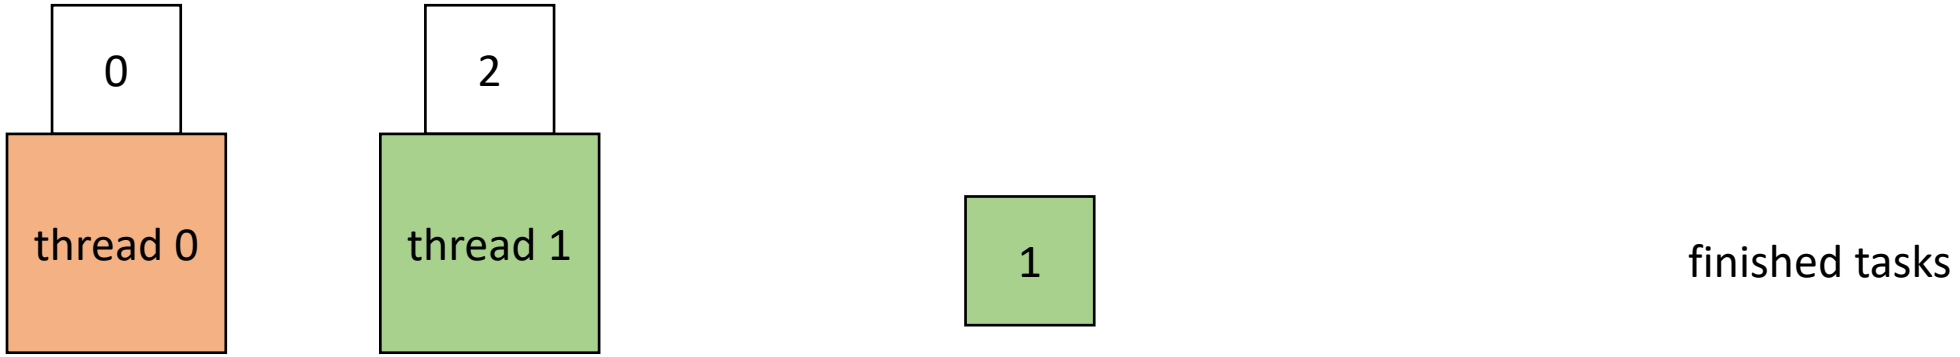
- Global worklist: threads take tasks (iterations) dynamically



Work stealing - global implicit worklist

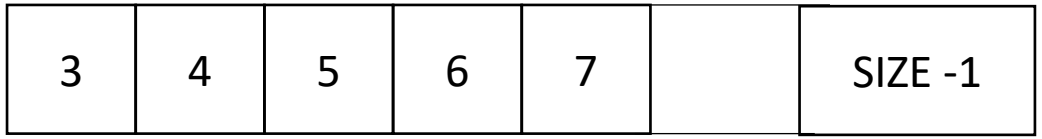
- Global worklist: threads take tasks (iterations) dynamically

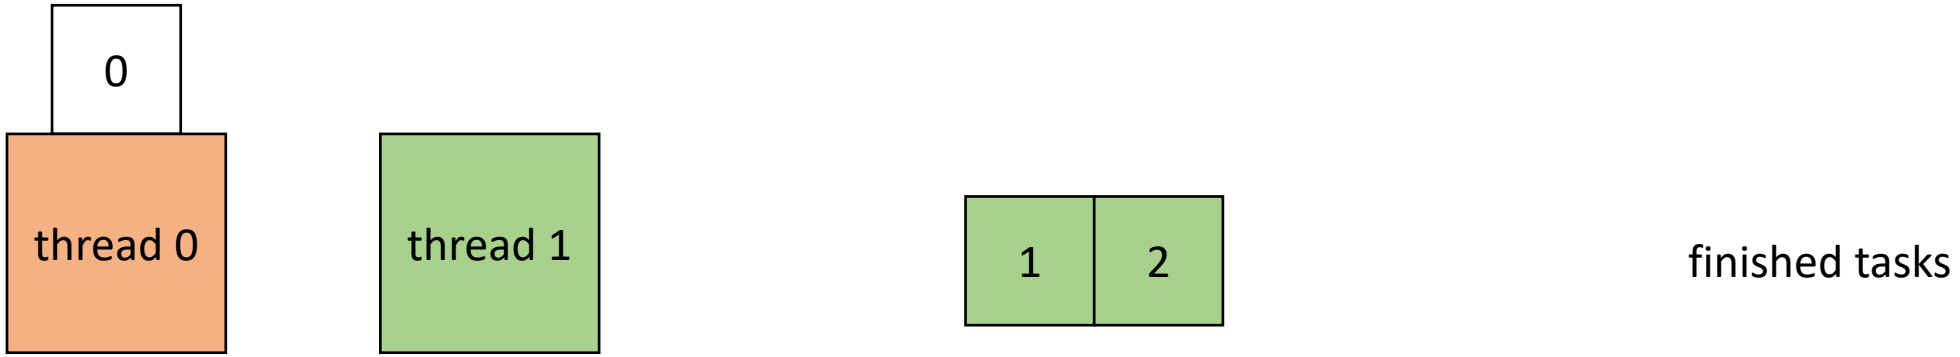




Work stealing - global implicit worklist

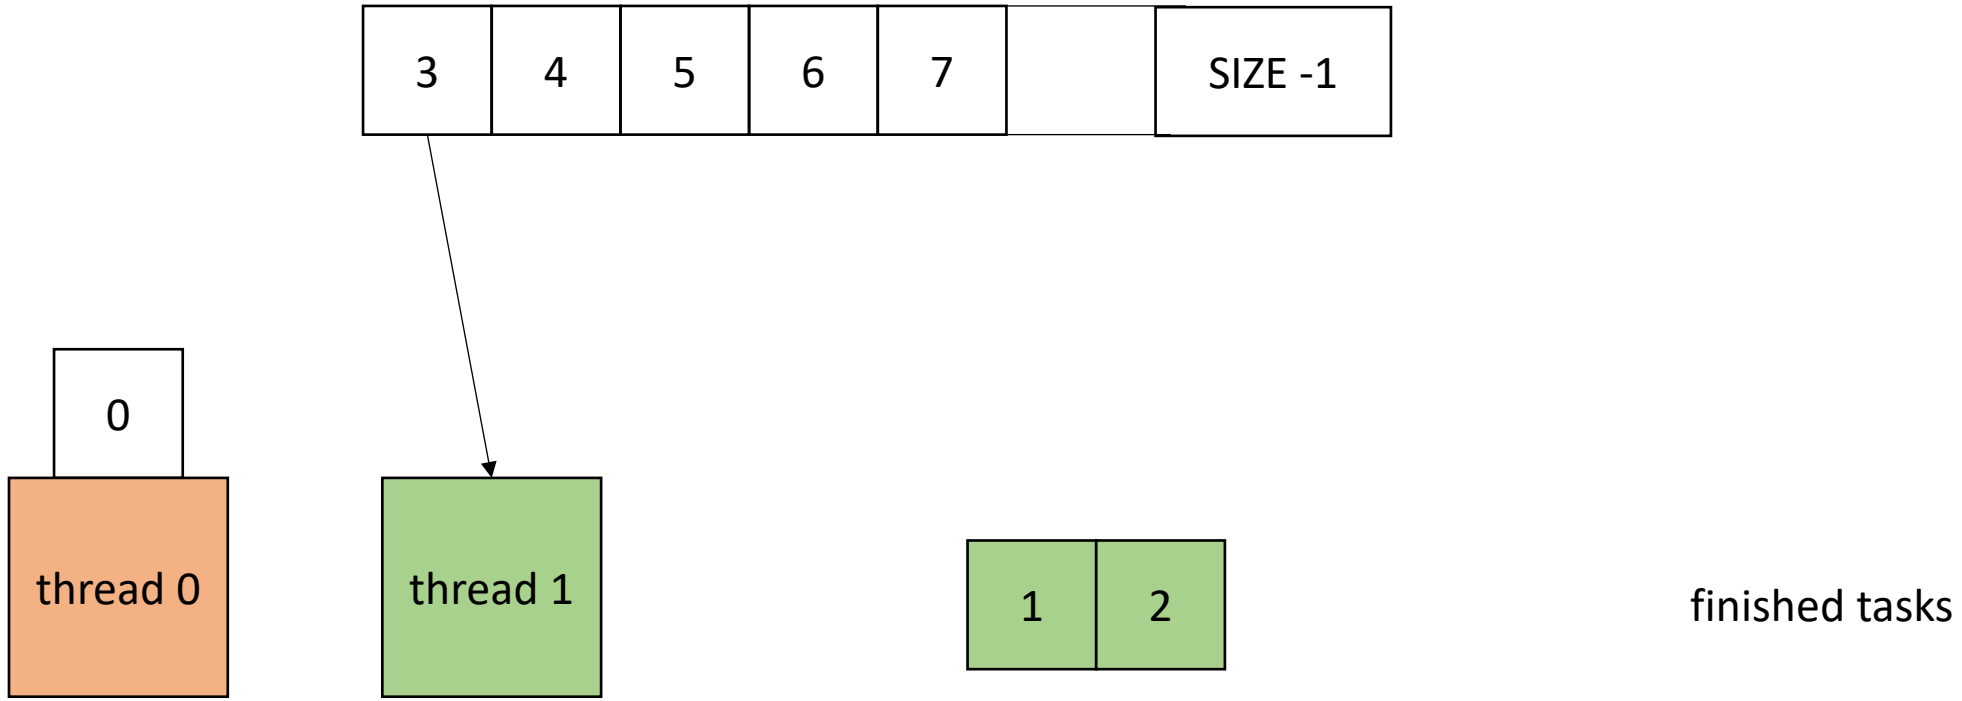
- Global worklist: threads take tasks (iterations) dynamically





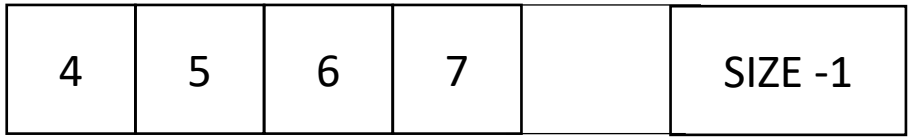
Work stealing - global implicit worklist

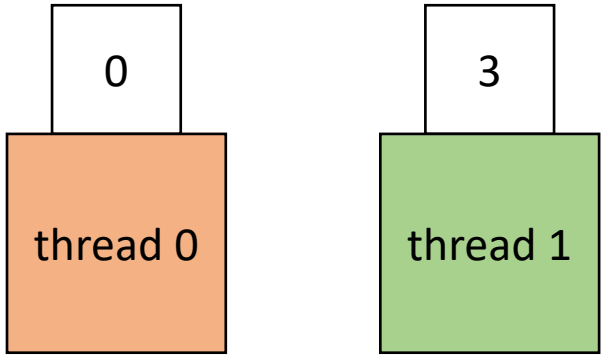
- Global worklist: threads take tasks (iterations) dynamically

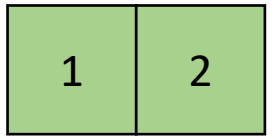


Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



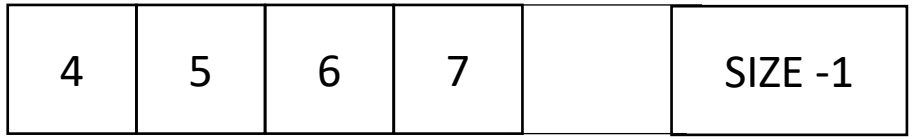


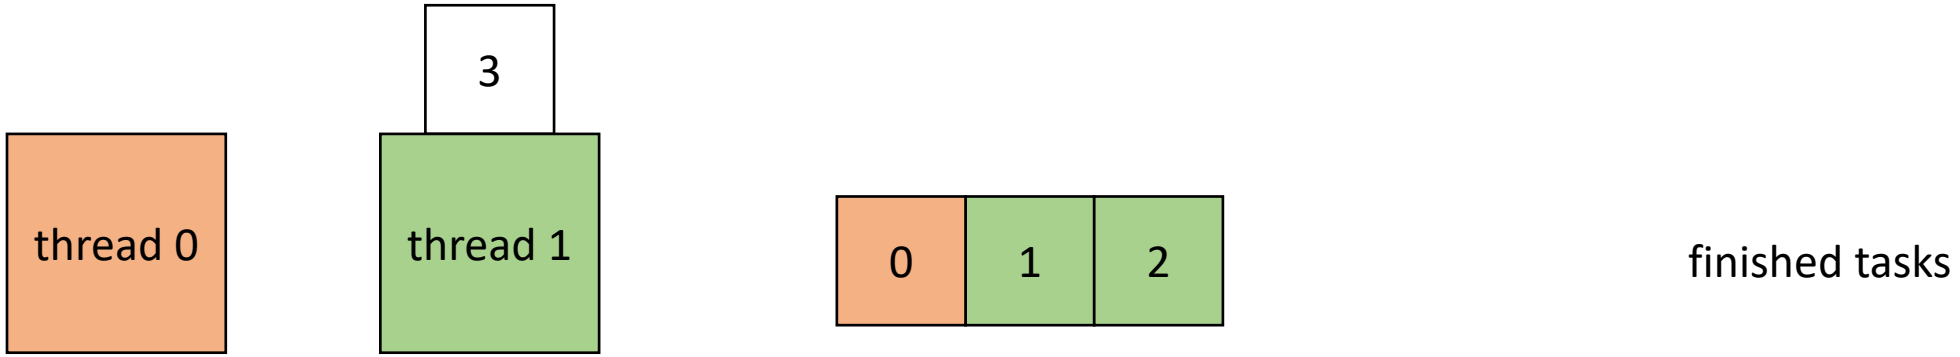


finished tasks

Work stealing - global implicit worklist

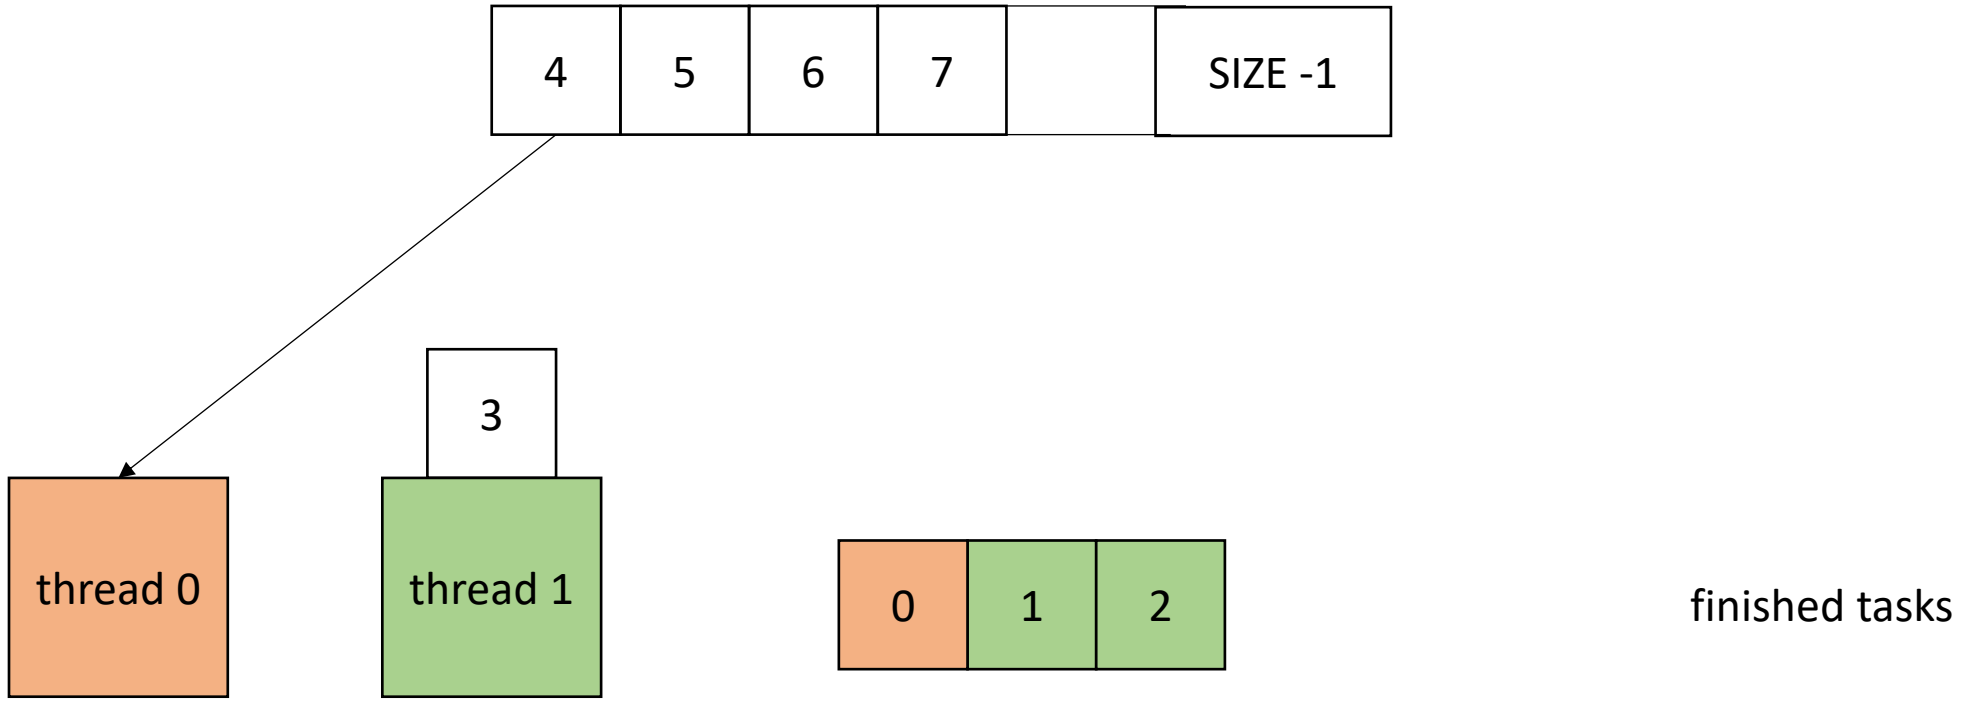
- Global worklist: threads take tasks (iterations) dynamically





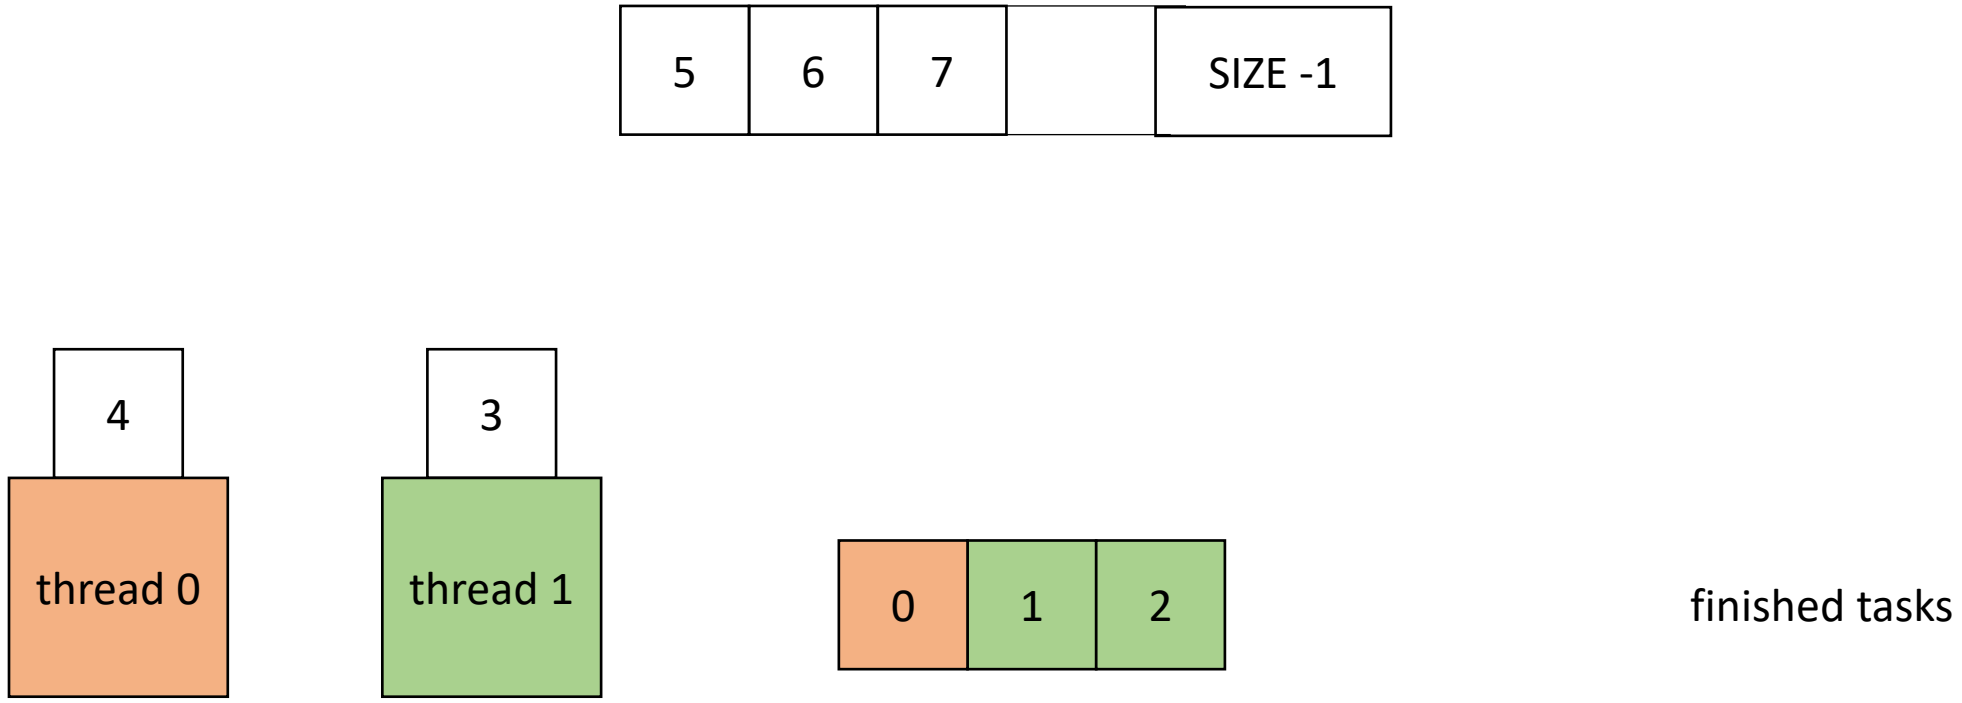
Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



Work stealing - global implicit worklist

- How to implement

```
void foo() {
  ...
  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
  ...
}
```

Work stealing - global implicit worklist

- How to implement

```
void foo() {
   ...
   for (x = 0; x < SIZE; x++) {
     // dynamic work based on x
   }
   ...
}
```

```
void parallel_loop(...) {

  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
}
```

Replicate code in a new function. Pass all needed variables as arguments.

Work stealing - global implicit worklist

- How to implement

```
void foo() {
   ...
   for (x = 0; x < SIZE; x++) {
     // dynamic work based on x
   }
   ...
}
```

```
atomic_int x(0);
void parallel_loop(...) {

  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
}
```

move loop variable to be a global atomic variable

Work stealing - global implicit worklist

- How to implement

```
void foo() {
   ...
   for (x = 0; x < SIZE; x++) {
      // dynamic work based on x
   }
   ...
}
```

```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = ??
            local_x < SIZE;
            local_x = ??) {

     // dynamic work based on x
  }
}
```

change loop bounds in new function to use a local variable using global variable.

Work stealing - global implicit worklist

- How to implement

These must be atomic updates!

```
void foo() {
   ...
   for (x = 0; x < SIZE; x++) {
      // dynamic work based on x
   }
   ...
}
```

```
atomic_int x(0);
void parallel_loop(...) {

   for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

      // dynamic work based on x
   }
}
```

change loop bounds in new function to use a local variable using global variable.

Work stealing - global implicit worklist

- How to implement

```
void foo() {
  ...
  for (t = 0; x < THREADS; t++) {
    spawn(parallel_loop);
  }
  join();
  ...
}
```

```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
           local_x < SIZE;
           local_x = atomic_fetch_add(&x,1)) {

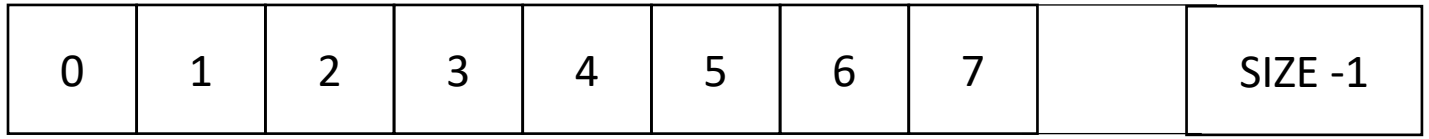
     // dynamic work based on x
  }
}
```

Spawn threads in original function and join them afterwards

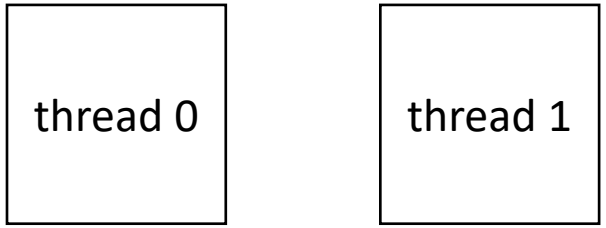
You will have to change to C++ syntax for the homework!

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



```
x: 0
0 - local_x - UNDEF
1 - local_x - UNDEF
```



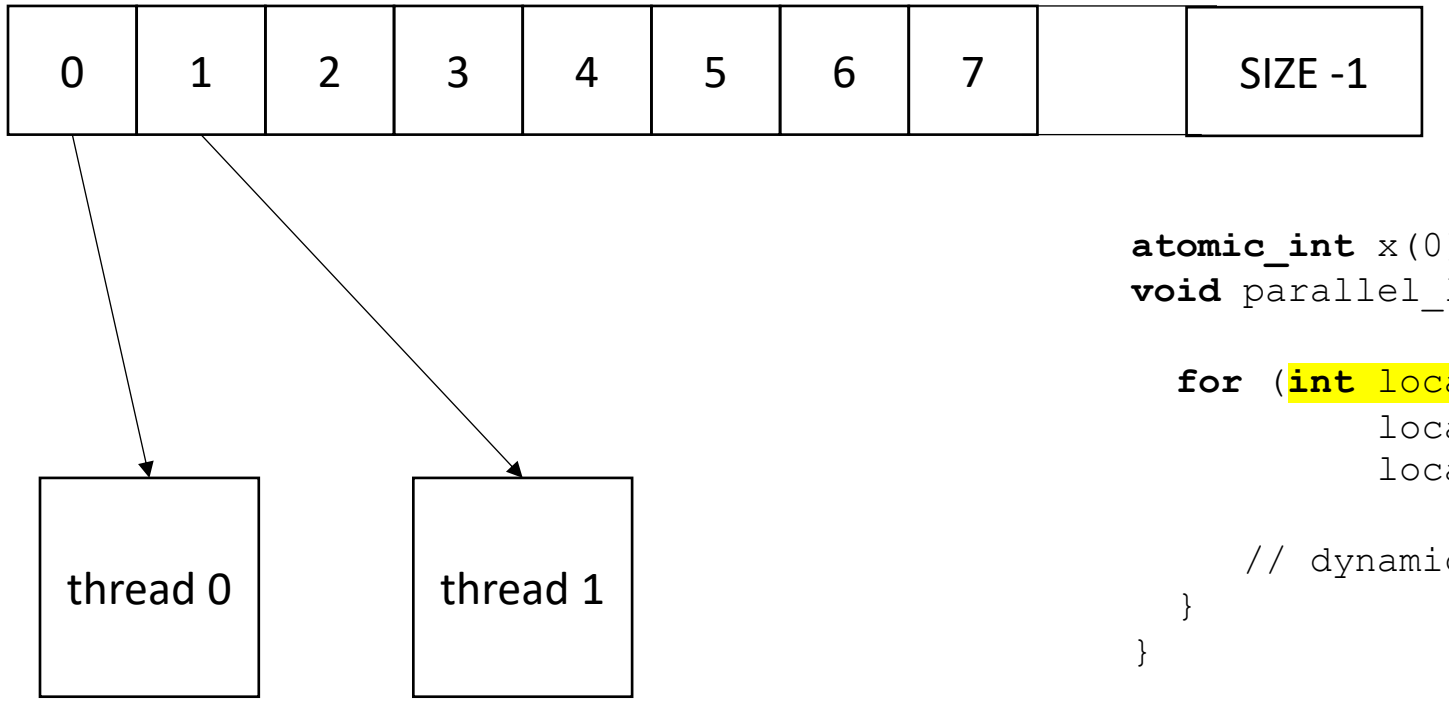
```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

     // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



```
x: 2
0 - local_x - 0
1 - local_x - 1
```

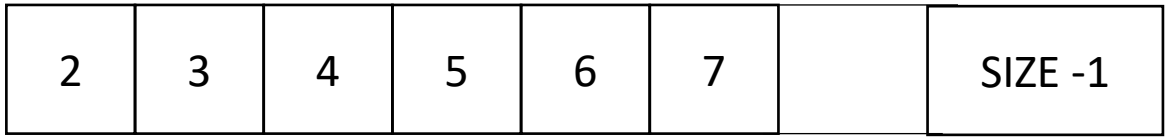
```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

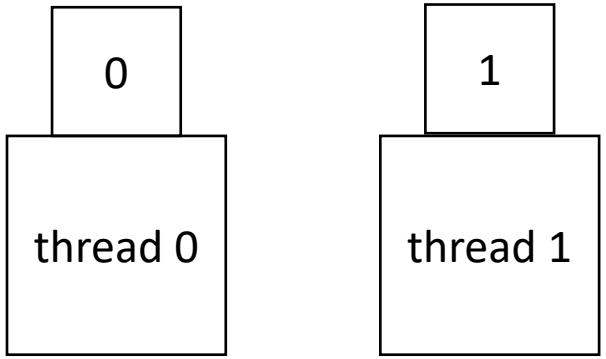
     // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



```
x: 2
0 - local_x - 0
1 - local_x - 1
```



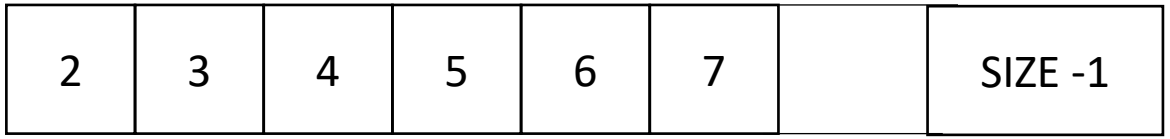
```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

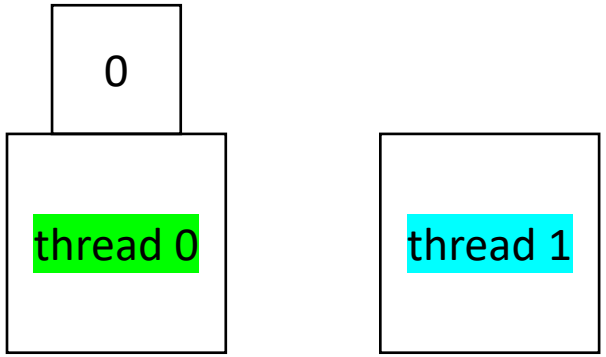
     // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



```
x: 2
0 - local_x - 0
1 - local_x - 1
```



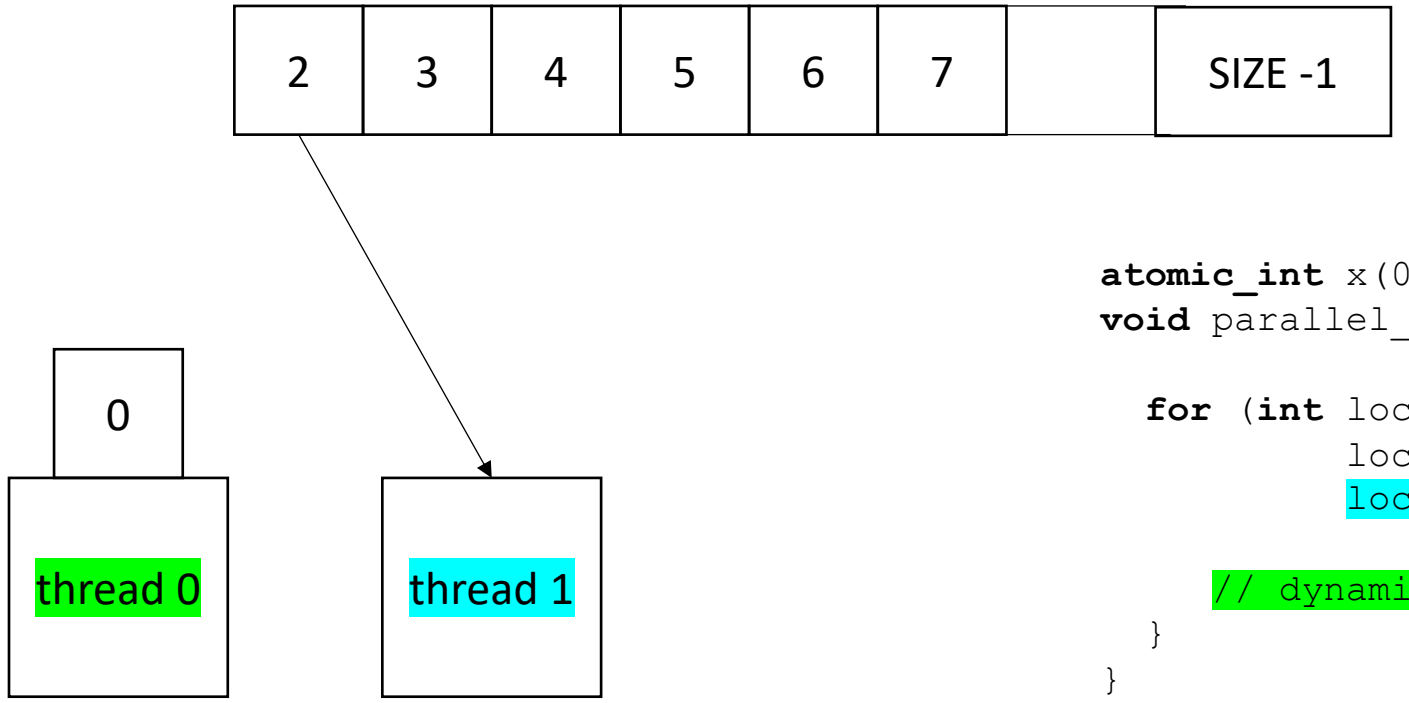
```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

      // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



```
x: 3
0 - local_x - 0
1 - local_x - 2
```

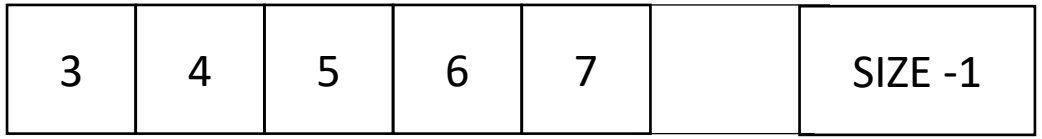
```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

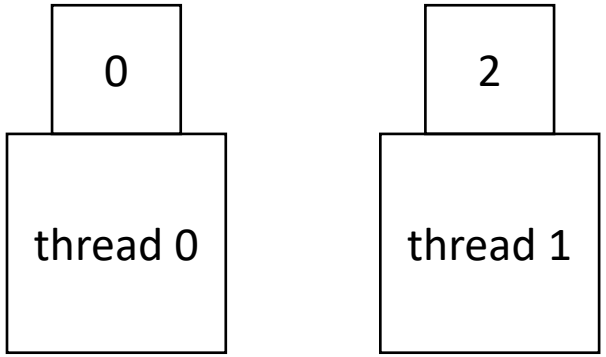
      // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



```
x: 3
0 - local_x - 0
1 - local_x - 2
```



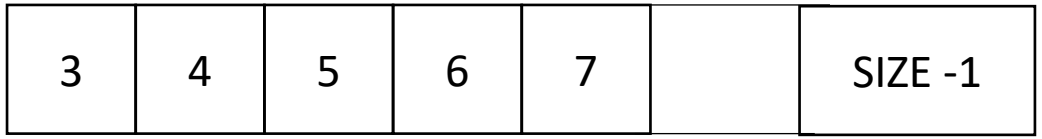
```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

     // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



```
x: 3
0 - local_x - 0
1 - local_x - 2
```

```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

      // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically

```
x: 4
0 - local_x - 0
1 - local_x - 3
```

```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

      // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically

```
x: 4
0 - local_x - 0
1 - local_x - 3
```

```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

     // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically

```
x: 4
0 - local_x - 0
1 - local_x - 3
```

```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

     // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically

```
x: 5
0 - local_x - 4
1 - local_x - 3
```

```
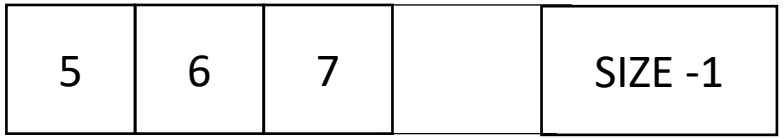
atomic_int(x);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

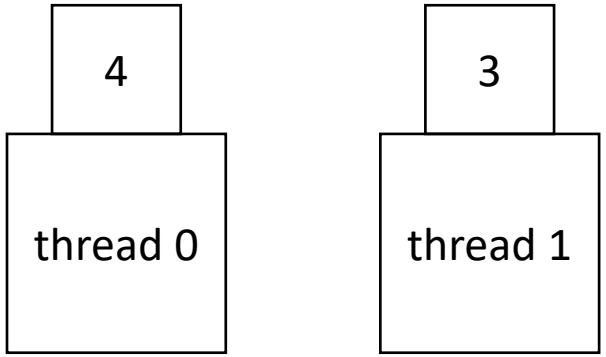
     // dynamic work based on x
  }
}
```

Work stealing - global implicit worklist

- Global worklist: threads take tasks (iterations) dynamically



```
x: 5
0 - local_x - 4
1 - local_x - 3
```



```
atomic_int x(0);
void parallel_loop(...) {

  for (int local_x = atomic_fetch_add(&x,1);
            local_x < SIZE;
            local_x = atomic_fetch_add(&x,1)) {

     // dynamic work based on x
  }
}
```

Schedule

- DOALL Loops

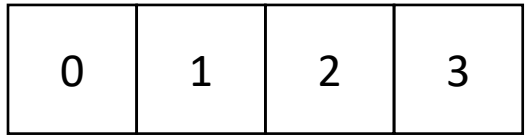
- **Parallel Schedules:**
  - Static
  - Global Worklists
  - **Local Worklists**

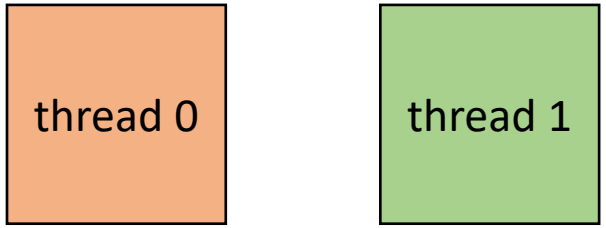
Work stealing - local worklists

- More difficult to implement
- low contention on local data-structures
- potentially better cache locality

Work stealing - local worklists

- local worklists: divide tasks into different worklists for each thread





Work stealing - local worklists

- local worklists: divide tasks into different worklists for each thread

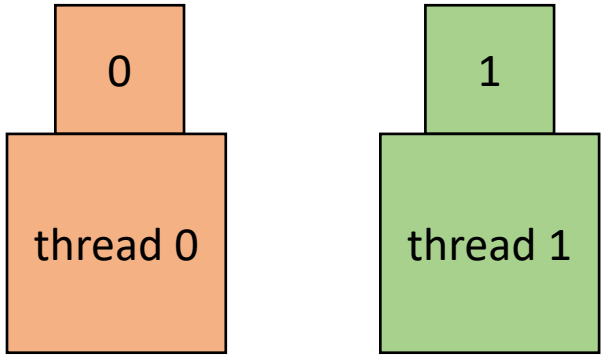
Queue 0

Queue 1



Work stealing - local worklists

- How to implement:

```
void foo() {
  ...
  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
  ...
}
```

Work stealing - local worklists

- How to implement:

```
void foo() {
   ...
   for (x = 0; x < SIZE; x++) {
     // dynamic work based on x
   }
   ...
}
```

```
void parallel_loop(..., int tid) {

   for (x = 0; x < SIZE; x++) {
     // dynamic work based on x
   }
}
```

Make a new function, taking any variables used in loop body as args. Additionally take in a thread id

Work stealing - local worklists

- How to implement:

```
concurrent_queue cq[NUM_THREADS];
void foo() {
  ...
  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
  ...
}
```

```
void parallel_loop(..., int tid) {

  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
}
```

Make a global array of concurrent queues

Work stealing - local worklists

- How to implement:

```
concurrent_queue cq[NUM_THREADS];
void foo() {
  ...
  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
  ...
}
```

```
void parallel_loop(..., int tid) {

  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
}
```

What type of queues?

Make a global array of concurrent queues

Work stealing - local worklists

- How to implement:

```
concurrent_queue cq[NUM_THREADS];
void foo() {
  ...
  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
  ...
}
```

```
void parallel_loop(..., int tid) {

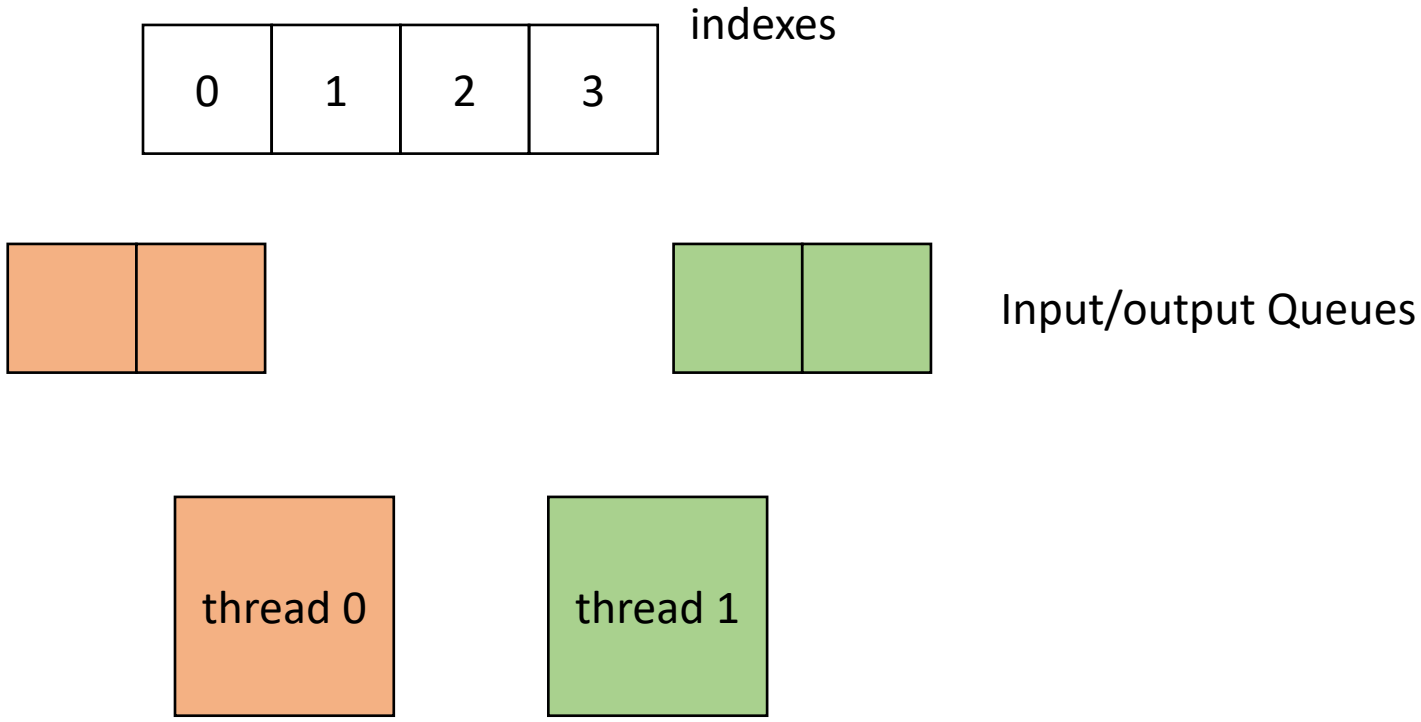
  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
}
```

Make a global array of concurrent queues

What type of queues?
We're going to use InputOutput Queues!

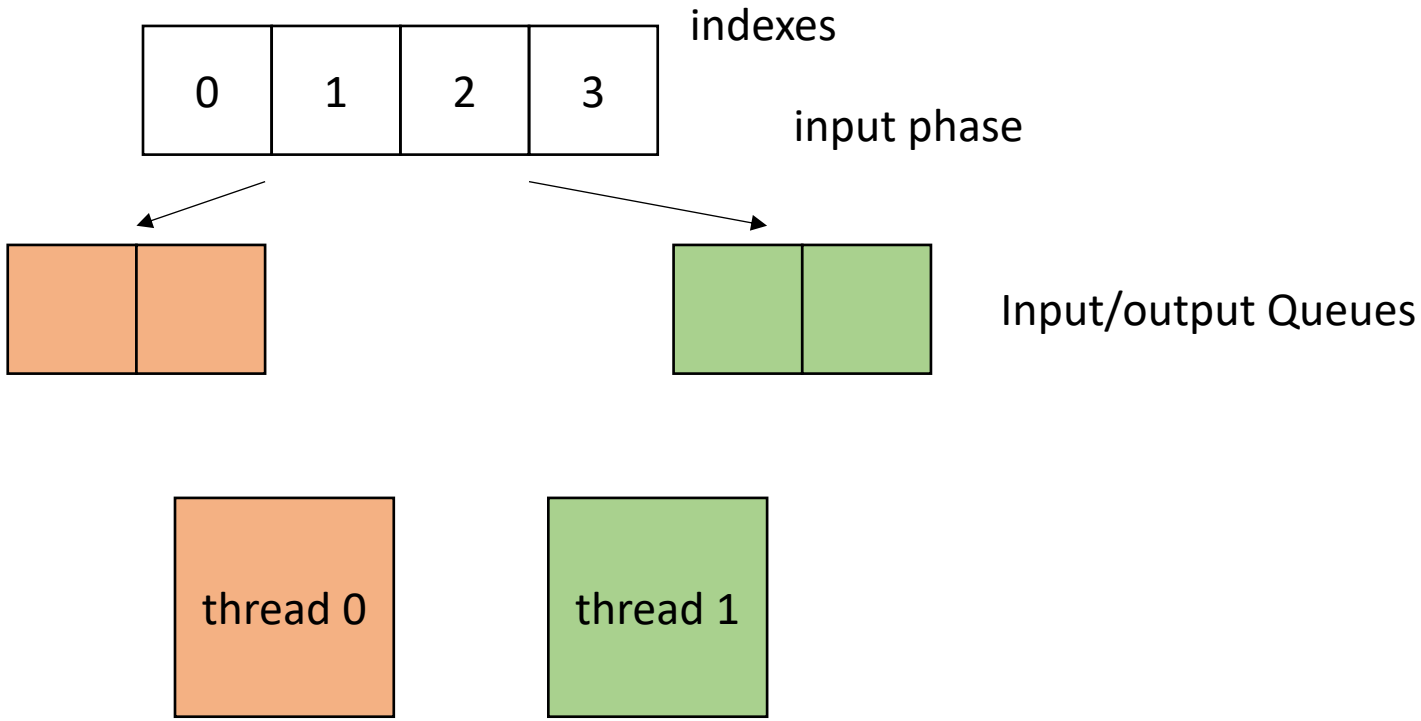
Work stealing - local worklists

- local worklists: divide tasks into different worklists for each thread



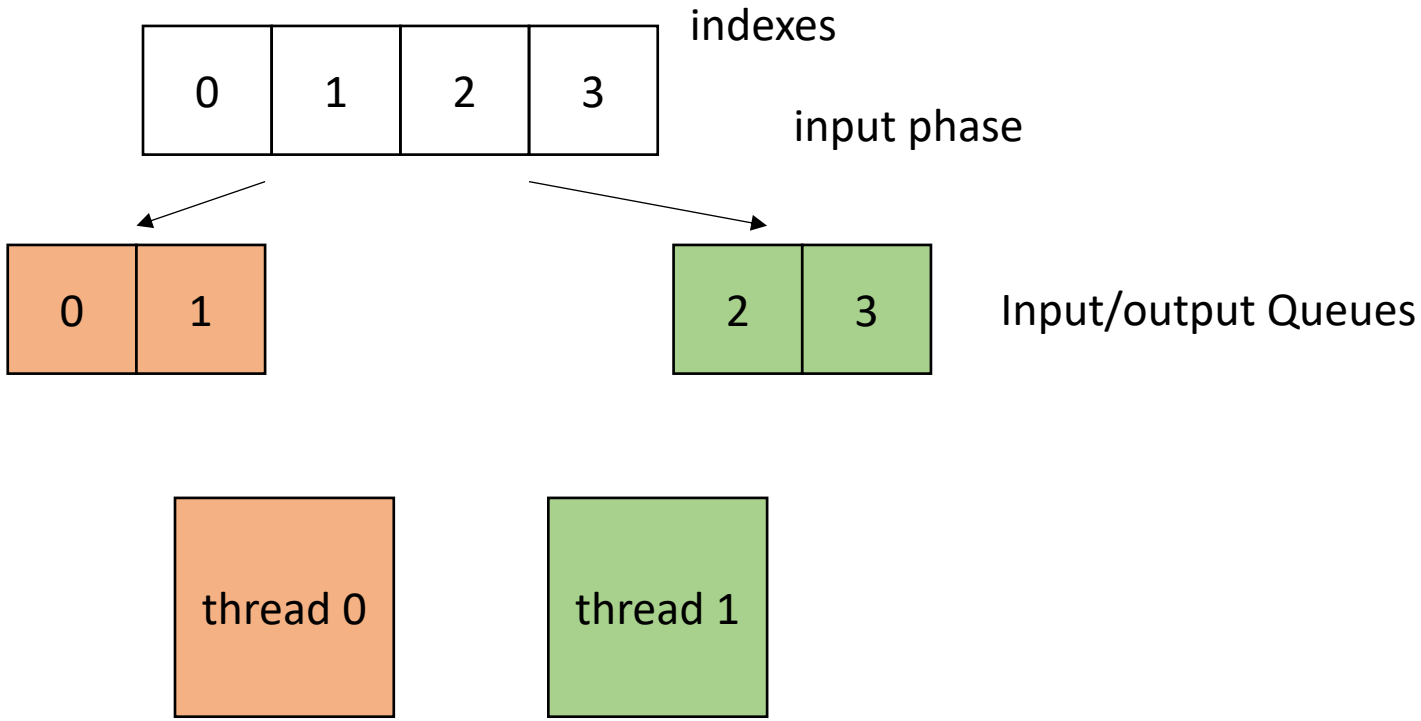
Work stealing - local worklists

- local worklists: divide tasks into different worklists for each thread



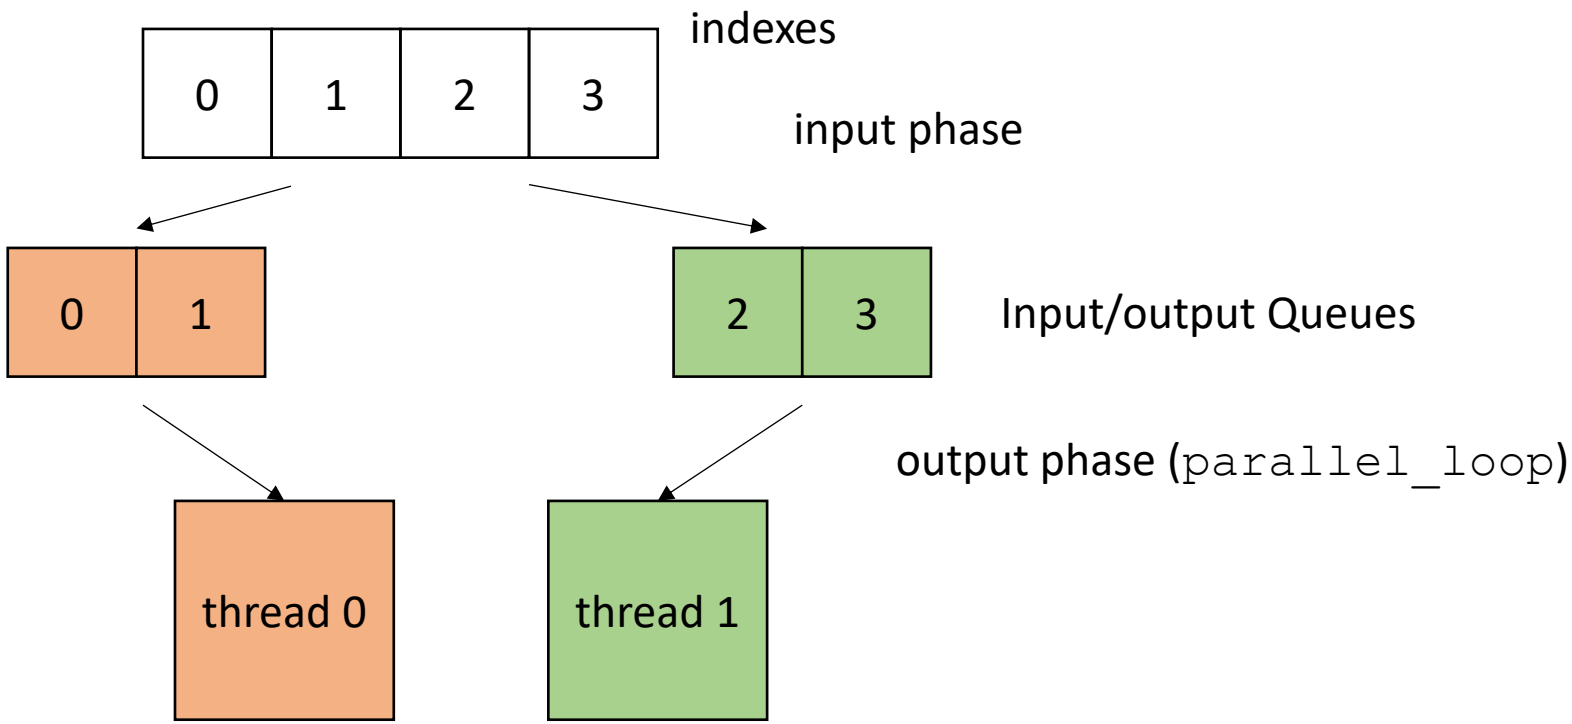
Work stealing - local worklists

- local worklists: divide tasks into different worklists for each thread



Work stealing - local worklists

- local worklists: divide tasks into different worklists for each thread



Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
   ...

   ...
}
```

First we need to initialize the queues

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
   ...
   // Spawn threads to initialize
   // join initializing threads

   ...
}
```

```
void parallel_enq(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    cq[tid].enq(x);
  }
}
```

Just like the static schedule, except we are enqueuing

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
   ...
   // Spawn threads to initialize
   // join initializing threads

   ...
}
```

Make sure to account for boundary conditions!

```
void parallel_enq(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    cq[tid].enq(x);
  }
}
```

Just like the static schedule, except we are enqueuing

Work stealing - local worklists

- How to implement in a compiler:

```
NUM_THREADS = 2;
SIZE = 4;
CHUNK = 2;
```

x	0	1	2	3

tid	0	0	1	1

Make sure to account for boundary conditions!

```
void parallel_enq(..., int tid, int num_threads)
{

  int chunk_size = SIZE / NUM_THREADS;
  int start = chunk_size * tid;
  int end = start + chunk_size;
  for (int x = start; x < end; x++) {
    cq[tid].enq(x);
  }
}
```

Just like the static schedule, except we are enqueuing

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
  ...
  // initialize queues
  // join threads

  // launch loop function
  ...
}
```

```
void parallel_loop(..., int tid, int num_threads) {

  for (x = 0; x < SIZE; x++) {
    // dynamic work based on x
  }
}
```

How do we modify the parallel loop?

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
  ...
  // initialize queues
  // join threads

  // launch loop function
  ...
}
```

```
void parallel_loop(..., int tid, int num_threads) {

  int task = 0;
  for (x = cq[tid].deq(); x != -1; x = cq[tid].deq())
  {
    // dynamic work based on task
  }
}
```

loop until the queue is empty

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
  ...
  // initialize queues
  // join threads

  // launch loop function
  ...
}
```

```
void parallel_loop(..., int tid, int num_threads) {

  int task = 0;
  for (x = cq[tid].deq(); x != -1; x = cq[tid].deq())
  {
    // dynamic work based on task
  }
}
```

loop until the queue is empty
Are we finished?

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
  ...
  // initialize queues
  // join threads

  // launch loop function
  ...
}
```

```
atomic_int finished_threads(0);
void parallel_loop(..., int tid, int num_threads) {

  int task = 0;
  for (x = cq[tid].deq(); x != -1; x = cq[tid].deq())
  {
    // dynamic work based on task
  }
  atomic_fetch_add(&finished_threads,1);
}
```

Track how many threads are finished

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
   ...
   // initialize queues
   // join threads

   // launch loop function
   ...
}
```

```
atomic_int finished_threads(0);
void parallel_loop(..., int tid, int num_threads) {

   int task = 0;
   for (x = cq[tid].deq(); x != -1; x = cq[tid].deq())
   {
      // dynamic work based on task
   }
   atomic_fetch_add(&finished_threads,1);
   while (finished_threads.load() != num_threads) {

   }
}
```

While there are threads that are still working

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
   ...
   // initialize queues
   // join threads

   // launch loop function
   ...
}
```

```
atomic_int finished_threads(0);
void parallel_loop(..., int tid, int num_threads) {

   int task = 0;
   for (x = cq[tid].deq(); x != -1; x = cq[tid].deq())
   {
      // dynamic work based on task
   }
   atomic_fetch_add(&finished_threads,1);
   while (finished_threads.load() != num_threads) {
      int target = // pick a thread to steal from
      int task = cq[target].deq();
   }
}
```

pick a random target and steal a task

Work stealing - local worklists

```
concurrent_queues cq[NUM_THREADS];
void foo() {
  ...
  // initialize queues
  // join threads

  // launch loop function
  // join loop threads
  ...
}
```

```
atomic_int finished_threads(0);
void parallel_loop(..., int tid, int num_threads) {

  int task = 0;
  for (x = cq[tid].deq(); x != -1; x = cq[tid].deq())
  {
    // dynamic work based on task
  }
  atomic_fetch_add(&finished_threads,1);
